

TOSHIBA CMOS DIGITAL INTEGRATED CIRCUIT SILICON MONOLITHIC

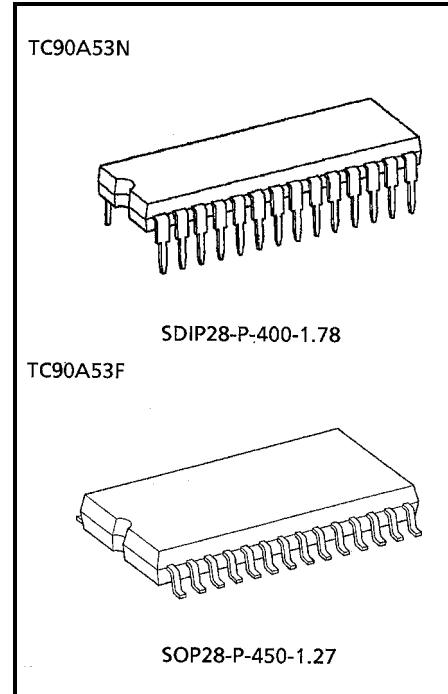

# TC90A53N, TC90A53F

## 3-LINE DIGITAL Y / C SEPARATOR IC

TC90A53N / F is a 3-line digital Y / C separator IC which separates luminance signal Y and chroma signal C from composite video signals. Toshiba's logical comb filter realizes good Y / C separation at low cost.

### FEATURES

- TV format : NTSC (3.58)
- Dynamic comb filter
- Vertical edge enhancement circuit
- PLL 4 × multiplier circuit
- Internal 8-bit 4 fsc AD converter
- Internal 8-bit 4 fsc DA converter (2 ch)
- 1-line color dot interference reducer circuit
- Sync tip clamp circuit
- Internal 2H-line memory
- Color killer mode (Y / C separation off)
- Chroma signal C output wide band mode
- Package : SDIP 28-pin and SOP 28-pin
- 5 V single power supply

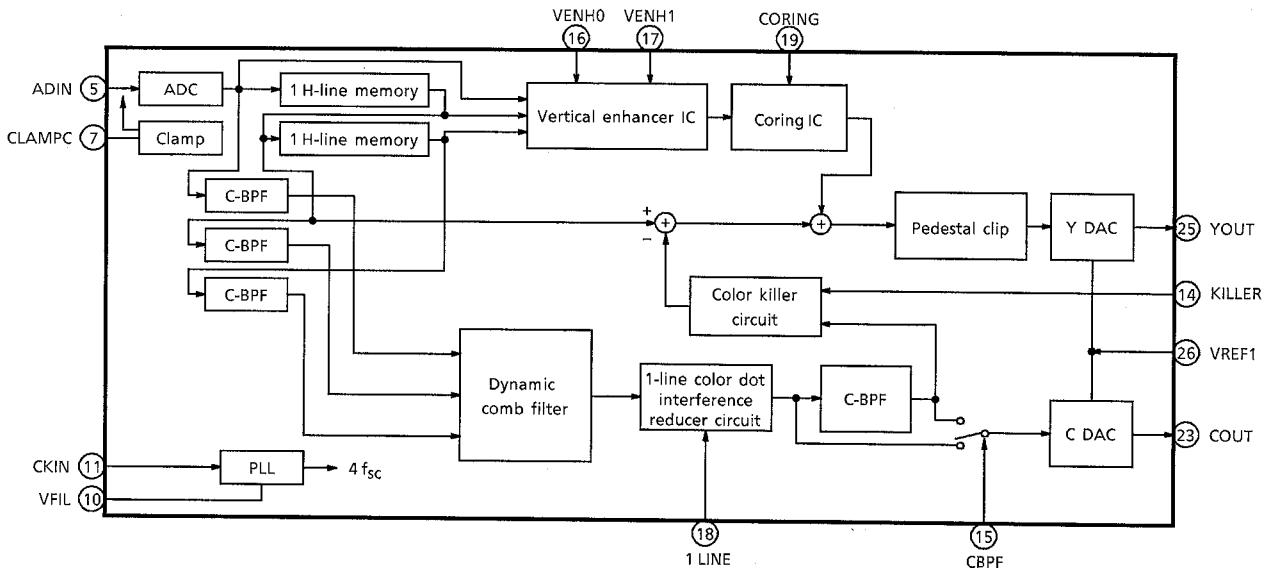

Weight:  
SDIP28-P-400-1.78: 1.7 g (Typ.)  
SOP28-P-450-1.27: 0.8 g (Typ.)

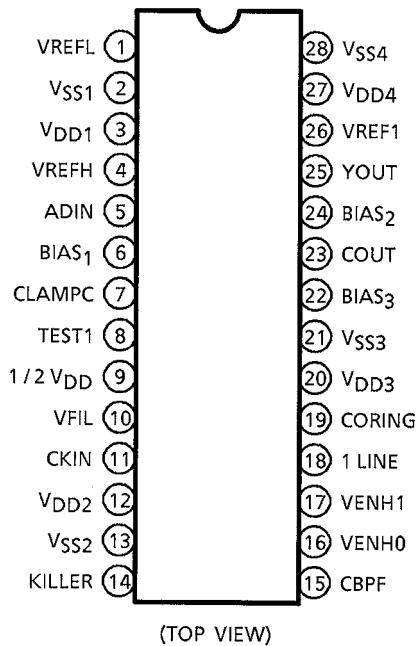

000707EBA1

- TOSHIBA is continually working to improve the quality and reliability of its products. Nevertheless, semiconductor devices in general can malfunction or fail due to their inherent electrical sensitivity and vulnerability to physical stress. It is the responsibility of the buyer, when utilizing TOSHIBA products, to comply with the standards of safety in making a safe design for the entire system, and to avoid situations in which a malfunction or failure of such TOSHIBA products could cause loss of human life, bodily injury or damage to property.
- In developing your designs, please ensure that TOSHIBA products are used within specified operating ranges as set forth in the most recent TOSHIBA products specifications. Also, please keep in mind the precautions and conditions set forth in the "Handling Guide for Semiconductor Devices," or "TOSHIBA Semiconductor Reliability Handbook" etc..
- The TOSHIBA products listed in this document are intended for usage in general electronics applications (computer, personal equipment, office equipment, measuring equipment, industrial robotics, domestic appliances, etc.). These TOSHIBA products are neither intended nor warranted for usage in equipment that requires extraordinarily high quality and/or reliability or a malfunction or failure of which may cause loss of human life or bodily injury ("Unintended Usage"). Unintended Usage include atomic energy control instruments, airplane or spaceship instruments, transportation instruments, traffic signal instruments, combustion control instruments, medical instruments, all types of safety devices, etc.. Unintended Usage of TOSHIBA products listed in this document shall be made at the customer's own risk.
- The products described in this document are subject to the foreign exchange and foreign trade laws.
- The information contained herein is presented only as a guide for the applications of our products. No responsibility is assumed by TOSHIBA CORPORATION for any infringements of intellectual property or other rights of the third parties which may result from its use. No license is granted by implication or otherwise under any intellectual property or other rights of TOSHIBA CORPORATION or others.
- The information contained herein is subject to change without notice.

14	KILLER	L : Color Mode H : Black And White Mode	28	V <sub>SS4</sub>	DAC GND

(Note) : Pins 9 and 26 need external bias.

## PIN FUNCTION

PIN No.	PIN NAME	FUNCTION	I / O	INTERFACE
1	V <sub>REFL</sub>	ADC bias pin. Sets lower limit of range D for ADC. Fixed internally to 1.5 V (typ.). Connect 0.01 $\mu$ F capacitor between this pin and GND.	—	
2	V <sub>SS1</sub>	ADC GND	—	—
3	V <sub>DD1</sub>	ADC power supply (+5 V)	—	—
4	V <sub>REFH</sub>	ADC bias pin. Sets upper limit of range D for ADC. Fixed internally to 3.5 V (typ.). Connect 0.01 $\mu$ F capacitor between this pin and GND.	—	
5	ADIN	Composite video signal input pin.	I	
6	BIAS1	ADC bias pin. Fixed internally to 1.3 V (typ.). Connect 0.01 $\mu$ F capacitor between this pin and GND.	—	
7	CLAMPC	External filter used for Sync tip clamping the input composite video signal. Connect 510 k $\Omega$ and 4700 pF between this pin and GND.	—	
8	TEST	Test pin. Connect GND.	—	—
9	1 / 2 V <sub>DD</sub>	Line-memory bias. Supply 1 / 2 V <sub>DD</sub> by dividing digital power supply using a resistor. Connect 0.01 $\mu$ F capacitor between this pin and GND.	I	

PIN No.	PIN NAME	FUNCTION	I / O	INTERFACE
10	V <sub>FIL</sub>	Connect a VCO filter.	—	
11	CKIN	Inputs clock. First DC-cut f <sub>sc</sub> clock in sync with color burst using a capacitor, then input the result.	I	
12	V <sub>DD2</sub>	PLL power supply (+5 V)	—	—
13	V <sub>SS2</sub>	PLL GND	—	—
14	KILLER	Selects color killer mode. L : Color mode H : Black and white mode (Y / C sep off)	I	
15	CBPF	Selects color signal horizontal band. L : Wide band (does not pass BPF) H : Narrow band (passes BPF)	I	
16 17	VENH0 VENH1	Select vertical enhance amount.  VENH0 VENH1 L L : Small (+0.25) H L : Small (+0.25) L H : Medium (+0.75) H H : Large (+1.25)	I	
18	1 LINE	1-line color dot interference reducer ON / OFF L : 1-line color dot interference reducer ON H : 1-line color dot interference reducer OFF	I	

PIN No.	PIN NAME	FUNCTION	I / O	INTERFACE
19	CORING	Selects coring. L : Coring ON (2LSB) H : Coring OFF (0LSB)	I	
20	V <sub>DD3</sub>	Digital power supply (+5 V)	—	—
21	V <sub>SS3</sub>	Digital GND	—	—
22	BIAS3	DAC bias pin. Fixed internally to 3.5 V (typ.). Connect a 0.01 μF capacitor between this pin and GND.	—	
23	COUT	Outputs C signal.	O	
24	BIAS2	DAC bias pin. Fixed internally to 1.6 V (typ.). Connect a 0.01 μF capacitor between this pin and GND.	—	
25	YOUT	Outputs Y signal.	O	
26	V <sub>REF1</sub>	DAC bias pin. Sets lower limit of range D for DAC. Supply power by dividing power for DAC using a resistor. Recommended value : 3.0 V	I	
27	V <sub>DD4</sub>	DAC power supply (+5 V)	—	—
28	V <sub>SS4</sub>	DAC GND	—	—

## DESCRIPTION OF FUNCTIONS

(1) CLAMP (Input clamp)

Circuit used to Sync tip clamp composite signal.

Apply feedback clamp so that at Y / C separation, the minimum data value after A / D conversion is the internally-fixed level.

(2) ADC (A / D converter)

High-speed series-parallel 8-bit A / D converter (Dynamic Range: 2.0V).

Input composite video signal with amplitude of 1.5 V<sub>p-p</sub> (sync to white 100%).

(3) 1 H memory

Line memory consisting of DRAM for 1 H delay. Two line memories configure a 3-line comb filter.

Because the system clock is 4 f<sub>sc</sub> (14.3 MHz), 910 clocks / 1 H is set.

(4) VENH (Vertical enhancer circuit)

After coring (2LSB) the non-correlation component among the three lines of the luminance signal, this block enhances the vertical outline. The enhance amount can be selected from three settings : large (+1.25), medium (+0.75), and small (+0.25).

The vertical enhance amount is added to the luminous signal obtained by subtracting the color signal from the composite signal, then the luminous signal is output via the D / A converter. Note that if the luminous signal is lower than the pedestal level (internally-fixed value), the vertical enhance amount is not added to.

(5) BPF (Horizontal bandpass filter)

Uses f<sub>sc</sub> as the center frequency. Filters the composite signal delayed by 0 H, 1 H, or 2 H and extracts the color signal.

The bandpass filter for outputting the color signal at a later stage can be switched on or off to select output of a narrow- or wide-band color signal.

(6) DCF (Vertical dynamic comb filter)

Vertical bandpass filter which extracts the color signal by detecting vertical non-correlation. Using Toshiba logic, determines the correlation among three lines. If no correlation, determines as the luminous signal and suppresses output of the color signal.

(7) 1-line color dot interference reducer circuit

Improves color dot interference on a screen where only 1 line has color so that the C signal is processed as the Y signal.

Extracts 1-line color dot component and the result is added to the output from the dynamic comb filter.

(8) RTIM (Clock / memory timing generator)

This block supplies × 4 f<sub>sc</sub> (14.3 MHz) obtained using the VCO via a buffer to the blocks and generates the timing signal necessary for memory.

(9) PLL (× 4 clock generator)

Multiplies f<sub>sc</sub> (3.58 MHz) by 4 and generates system clock 4 f<sub>sc</sub> (14.3 MHz).

(10) DAC (D / A converter)

High-speed 8-bit D / A converter. The output amplitudes are : Y output of 1.5 V<sub>p-p</sub> (typ.) and C output at burst level of 572 mV<sub>p-p</sub> (typ.).

(11) Color killer circuit

When the input video signal is a monochrome image, this circuit enables effective use of the luminance signal information regardless of whether there is a burst signal. It does this by preventing the chroma signal output from the comb filter from being subtracted from the luminance signal.

While the VBI signal is active it is better not to use the comb function. Setting the KILLER pin to High at this time enables the use of character multiplex and other signals from the Y output unchanged.

But since Vertical edge enhancement does not become OFF, be careful when using with Vertical edge enhancement.

## MODE LIST

PIN14 KILLE R	PIN15 CBPF	PIN16 VENH0	PIN17 VENH1	PIN18 1 LINE	PIN19 CORING	MODE	OPERATION
L	—	—	—	—	—	Y / C separation ON	Color mode
H	—	—	—	—	—	Y / C separation OFF	Black and white mode (killer)
—	L	—	—	—	—	Color signal horizontal band, wide	Does not pass BPF for color signal output.
—	H	—	—	—	—	Color signal horizontal band, narrow	Passes BPF for color signal output.
—	—	L	L	—	—	Vertical enhance small	Enhance amount : (+0.25)
—	—	H	L	—	—	Vertical enhance small	Enhance amount : (+0.25)
—	—	L	H	—	—	Vertical enhance medium	Enhance amount : (+0.75)
—	—	H	H	—	—	Vertical enhance large	Enhance amount : (+1.25)
—	—	—	—	L	—	1-line color dot interference reducer circuit ON	
—	—	—	—	H	—	1-line color dot interference reducer circuit OFF	
—	—	—	—	—	L	Coring ON	Coring circuit ON (2LSB)
—	—	—	—	—	H	Coring OFF	Coring circuit OFF (0LSB)

MAXIMUM RATINGS ( $T_a = 25^\circ\text{C}$ )
