## ÷ 2 Divider

The MC10EP32 is an integrated ÷ 2 divider. The differential clock inputs and the  $V_{BB}$  allow a differential, single-ended or AC coupled interface to the device. If used, the  $V_{BB}$  output should be bypassed to ground with a 0.01µF capacitor.

The reset pin is asynchronous and is asserted on the rising edge. Upon power-up, the internal flip-flops will attain a random state; the reset allows for the synchronization of multiple EP32's in a system.
