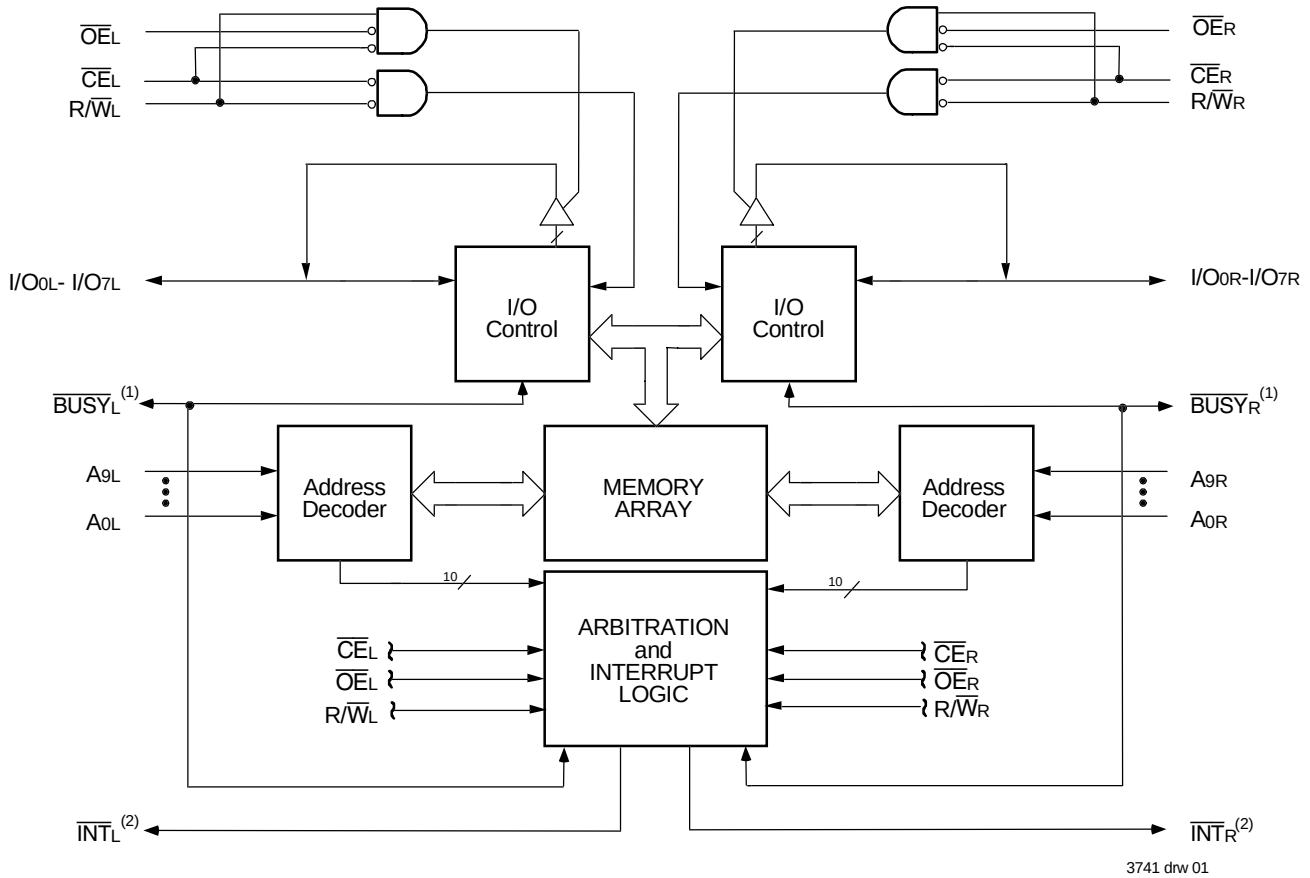
HIGH-SPEED 3.3V 1K X 8 DUAL-PORT STATIC RAM

IDT71V30S/L

Features

- **High-speed access**
  - *Commercial: 25/35/55ns (max.)*
- **Low-power operation**
  - *IDT71V30S*
    Active: 375mW (typ.)
    Standby: 5mW (typ.)
  - *IDT71V30L*
    Active: 375mW (typ.)
    Standby: 1mW (typ.)
- **On-chip port arbitration logic**
- **Interrupt flags for port-to-port communication**
- **Fully asynchronous operation from either port**
- **Battery backup operation, 2V data retention (L Only)**
- **TTL-compatible, single 3.3V ±0.3V power supply**
- **Industrial temperature range (-40°C to +85°C) is available for selected speeds**

Functional Block Diagram



3741 drw 01

NOTES:
1. IDT71V30: $\overline{BUSY}$ outputs are non-tristatable push-pulls.
2. $\overline{INT}$ outputs are non-tristable push-pull output structure.

JANUARY 2001

Description

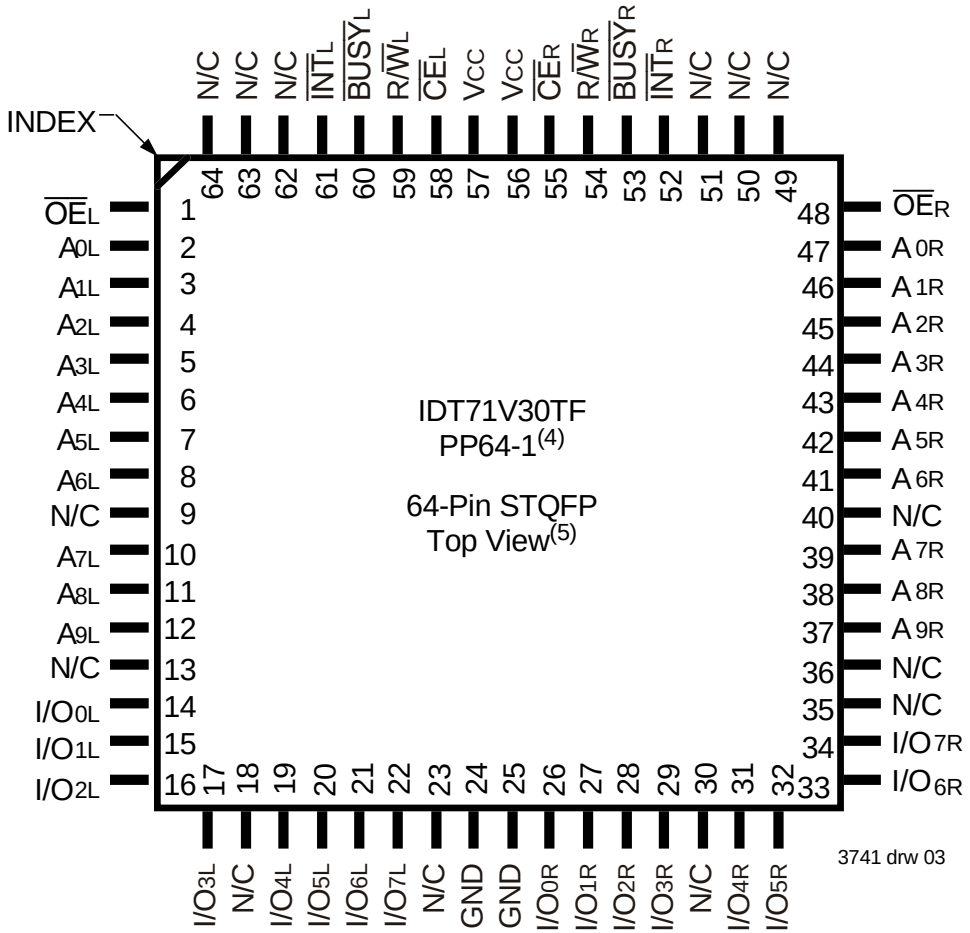
The IDT71V30 is a high-speed 1K x 8 Dual-Port Static RAM. The IDT71V30 is designed to be used as a stand-alone 8-bit Dual-Port SRAM.

Both devices provide two independent ports with separate control, address, and I/O pins that permit independent, asynchronous access for reads or writes to any location in memory. An automatic power down feature, controlled by $\overline{CE}$, permits the on chip circuitry of each port to enter a very low standby power mode.

Fabricated using IDT's CMOS high-performance technology, these devices typically operate on only 375mW of power. Low-power (L) versions offer battery backup data retention capability, with each Dual-Port typically consuming 200µW from a 2V battery.

The IDT71V30 devices are packaged in 64-pin STQFPs.

Pin Configurations[1,2,3]



NOTES:

1. All Vcc pins must be connected to the power supply.
2. All GND pins must be connected to the ground supply.
3. Package body is approximately 10mm x 10mm x 1.4mm.
4. This package code is used to reference the package diagram.
5. This text does not indicate the orientation of the actual part-marking.

Absolute Maximum Ratings(1)

Symbol	Rating	Com'l & Ind	Unit
V_{TERM}(2)	Terminal Voltage with Respect to GND	-0.5 to +4.60	V
T_{BIAS}	Temperature Under Bias	-55 to +125	°C
T_{STG}	Storage Temperature	-65 to +150	°C
I_{OUT}	DC Output Current	50	mA

3741 tbl 01

NOTES:
1. Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of the specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
2. V_{TERM} must not exceed Vcc + 0.3V for more than 25% of the cycle time or 10ns maximum, and is limited to $\leq$ 20mA for the period of $V_{TERM} \geq$ Vcc + 0.3V.

Capacitance(1) (T_A = +25°C, f=1.0MHz)

Symbol	Parameter	Conditions(2)	Max.	Unit
C_{IN}	Input Capacitance	V_{IN} = 3dV	9	pF
C_{OUT}	Output Capacitance	V_{OUT} = 3dV	10	pF

3741 tbl 04

NOTES:
1. This parameter is determined by device characterization but is not production tested.
2. 3dv references the interpolated capacitance when the input and output signals switch from 0V to 3V or from 3V to 0V.

Recommended DC Operating Conditions

Symbol	Parameter	Min.	Typ.	Max.	Unit
V_{CC}	Supply Voltage	3.0	3.3	3.6	V
GND	Ground	0	0	0	V
V_{IH}	Input High Voltage	2.0	—	V_{CC}+0.3V	V
V_{IL}	Input Low Voltage	-0.3(1)	—	0.8	V

3741 tbl 02

NOTE:
1. V_{IL} (min.) = -1.5V for pulse width less than 20ns.

Maximum Operating Temperature and Supply Voltage(1,2)

Grade	Ambient Temperature	GND	Vcc
Commercial	0°C to +70°C	0V	3.3V $\pm$ 0.3
Industrial	-40°C to +85°C	0V	3.3V $\pm$ 0.3

3741 tbl 03

NOTES:
1. This is the parameter T_A. This is the "instant on" case temperature.
2. Industrial temperature: for specific speeds, packages and powers, contact your sales office.

DC Electrical Characteristics Over the Operating Temperature and Supply Voltage Range (Vcc = 3.3V ± 0.3V)

Symbol	Parameter	Test Conditions	71V30S		71V30L		Unit

NOTES:
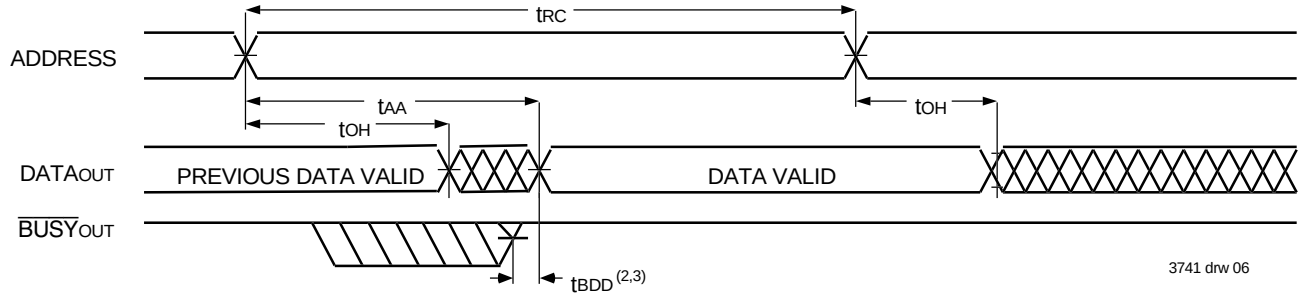
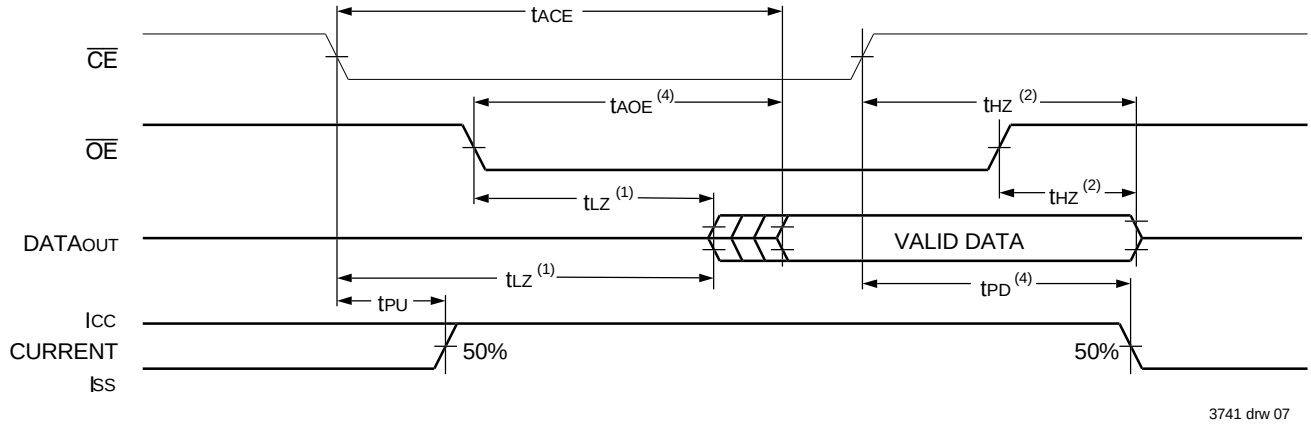
1. Transition is measured 0mV from Low- or High-impedance voltage with Output Test Load (Figure 2).
2. This parameter is guaranteed by device characterization, but is not production tested.
3. 'X' in part number indicates power rating (S or L).
4. Industrial temperature: for specific speeds, packages and power contact your sales office.

Timing Waveform of Read Cycle No. 1, Either Side(1)



NOTES:
1. R/$\overline{W}$ = V_{IH}, $\overline{CE}$ = V_{IL}, and is $\overline{OE}$ = V_{IL}. Address is valid prior to the coincidental with $\overline{CE}$ transition LOW.
2. t_{BDD} delay is required only in case where the opposite is port is completing a write operation to same the address location. For simultaneous read operations $\overline{BUSY}$ has no relationship to valid output data.
3. Start of valid data depends on which timing becomes effective last t_{AOE}, t_{ACE}, t_{AA}, and t_{BDD}.

Timing Waveform of Read Cycle No. 2, Either Side(3)



NOTES:
1. Timing depends on which signal is asserted last, $\overline{OE}$ or $\overline{CE}$.
2. Timing depends on which signal is desserted first, $\overline{OE}$ or $\overline{CE}$.
3. R/$\overline{W}$ = V_{IH} and the address is valid prior to or coincidental with $\overline{CE}$ transition LOW.
4. Start of valid data depends on which timing becomes effective last t_{AOE}, t_{ACE}, and t_{BDD}.

AC Electrical Characteristics Over the Operating Temperature and Supply Voltage[4,5]

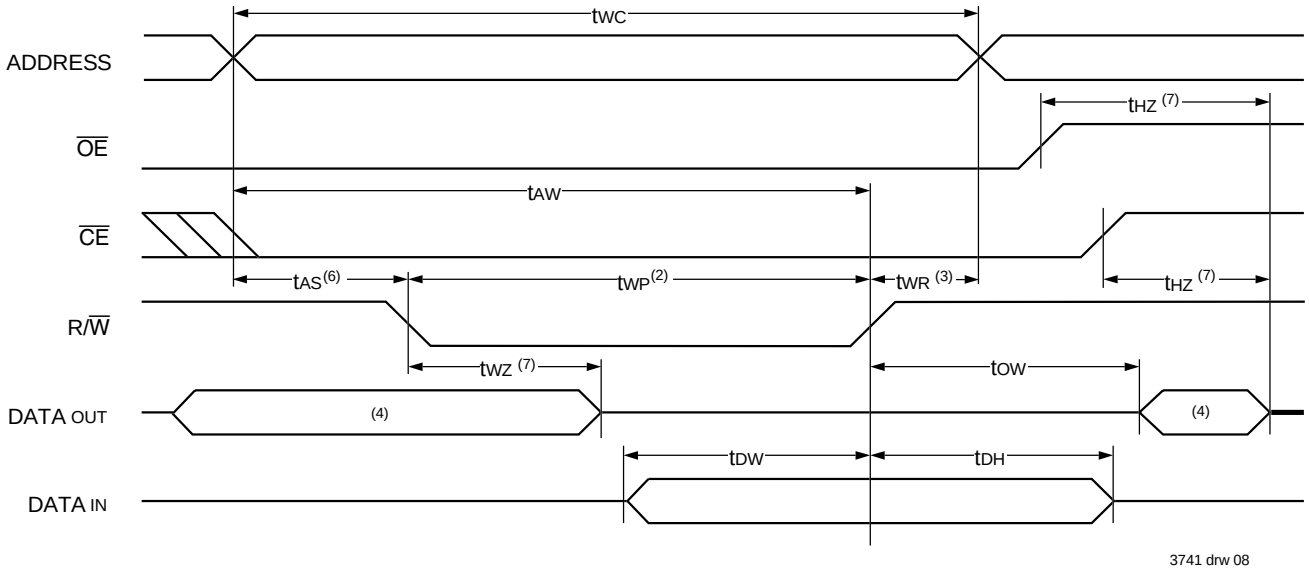
t_{DH}	Data Hold Time[3]	0	—	0	—	0	—	ns
t_{WZ}	Write Enable to Output in High-Z[1,2]	—	15	—	15	—	30	ns
t_{OW}	Output Active from End-of-Write[1,2,3]	0	—	0	—	0	—	ns

3741 tbl 10

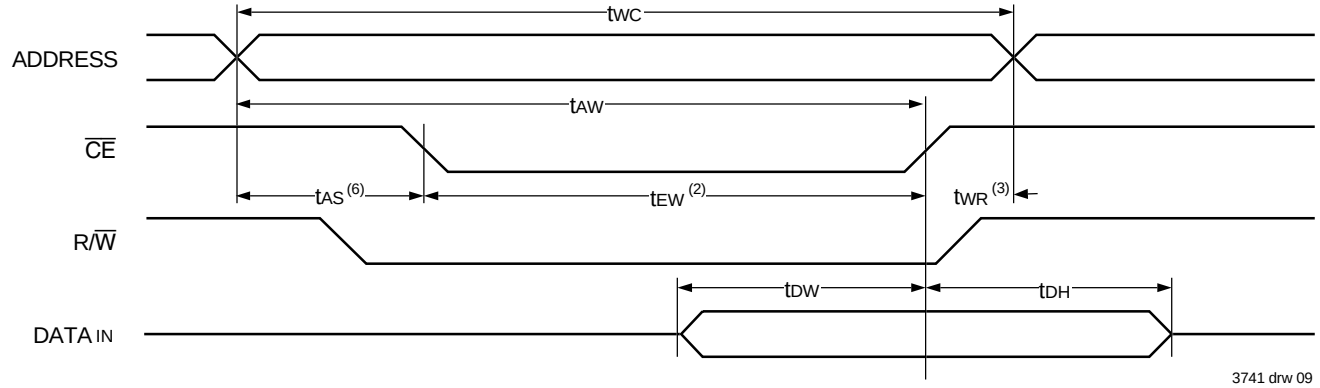
NOTES:
1. Transition is measured 0mV from Low- or High-impedance voltage with Output Test Load (Figure 2).
2. This parameter is guaranteed by device characterization, but is not production tested.
3. The specification for t_{DH} must be met by the device supplying write data to the SRAM under all operating conditions. Although t_{DH} and t_{OW} values will vary over voltage and temperature, the actual t_{DH} will always be smaller than the actual t_{OW}.
4. 'X' in part number indicates power rating (S or L).
5. Industrial temperatures: for specific speeds, packages and powers contact your sales office.

Timing Waveform of Write Cycle No. 1,(R/$\overline{W}$ Controlled Timing)(1,5,8)



3741 drw 08

Timing Waveform of Write Cycle No. 2, $\overline{CE}$ Controlled Timing(1,5)



3741 drw 09

NOTES:

1. R/$\overline{W}$ or $\overline{CE}$ must be HIGH during all address transitions.
2. A write occurs during the overlap (t_{EW} or t_{WP}) of $\overline{CE}$ = V_{IL} and R/$\overline{W}$= V_{IL}.
3. t_{WR} is measured from the earlier of $\overline{CE}$ or R/$\overline{W}$ going HIGH to the end of the write cycle.
4. During this period, the I/O pins are in the output state and input signals must not be applied.
5. If the $\overline{CE}$ LOW transition occurs simultaneously with or after the R/$\overline{W}$ LOW transition, the outputs remain in the High-impedance state.
6. Timing depends on which enable signal ($\overline{CE}$ or R/$\overline{W}$) is asserted last.
7. This parameter is determined be device characterization, but is not production tested. Transition is measured 0mV from steady state with the Output Test Load (Figure 2).
8. If $\overline{OE}$ is LOW during a R/$\overline{W}$ controlled write cycle, the write pulse width must be the larger of t_{WP} or (t_{WZ} + t_{DW}) to allow the I/O drivers to turn off data to be placed on the bus for the required t_{DW}. If $\overline{OE}$ is HIGH during a R/$\overline{W}$ controlled write cycle, this requirement does not apply and the write pulse can be as short as the specified t_{WP}.

AC Electrical Characteristics Over the Operating Temperature and Supply Voltage Range(6,7)

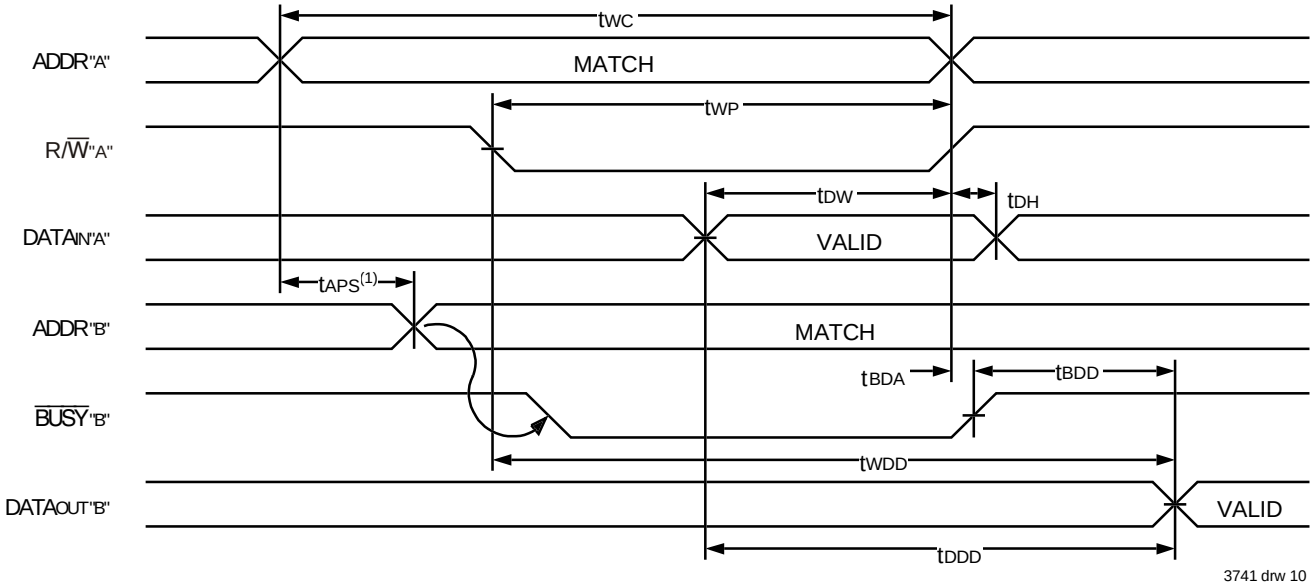
3741 tbl 11

NOTES:
1. Port-to-port delay through SRAM cells from writing port to reading port, refer to "Timing Waveform of Write with Port-to-Port Read with BUSY".
2. To ensure that the earlier of the two ports wins.
3. t_{BDD} is a calculated parameter and is the greater of 0, $t_{WDD} - t_{WP}$ (actual) or $t_{DDD} - t_{DW}$ (actual).
4. To ensure that the Write Cycle is inhibited on Port "B" during contention on Port "A".
5. To ensure that the Write Cycle is completed on Port "B" after contention on Port "A".
6. 'X' in part number indicates power rating (S or L).
7. Industrial temperature: for specific speeds, packages and powers contact your sales office.

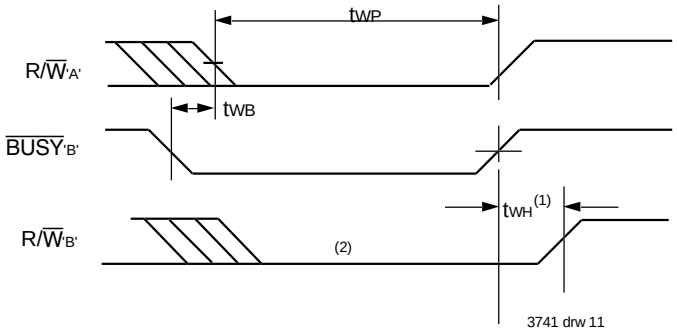
Timing Waveform of Write with Port-to-Port Read with $\overline{BUSY}$(1,2,3,4)



3741 drw 10

NOTES:
1. To ensure that the earlier of the two ports wins.
2. $\overline{CE}_L = \overline{CE}_R = V_{IL}$
3. $\overline{OE} = V_{IL}$ for the reading port.
4. All timing is the same for the left and right ports. Port 'A' may be either the left or right port. Port "B" is opposite from port "A".

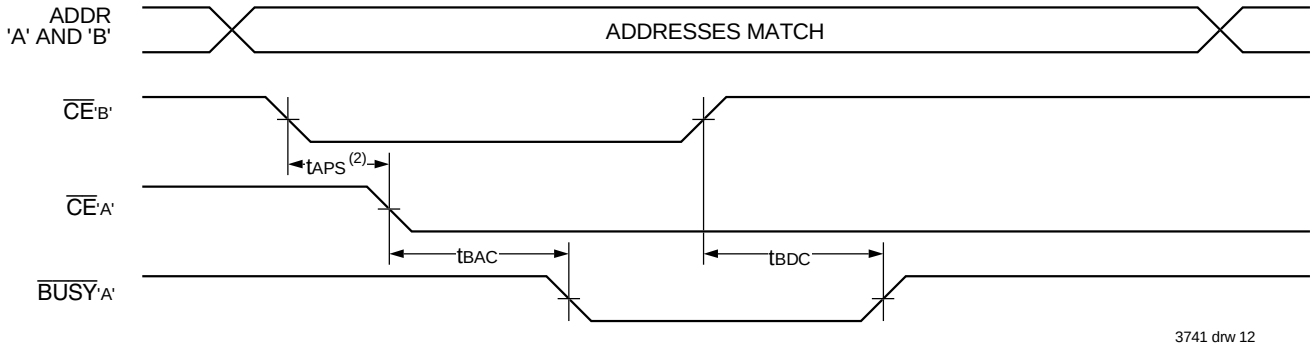
Timing Waveform of Write with $\overline{BUSY}$(3)



3741 drw 11

NOTES:
1. t_{WH} must be met for $\overline{BUSY}$.
2. $\overline{BUSY}$ is asserted on port 'B' blocking R/$\overline{W}$'B', until $\overline{BUSY}$'B' goes HIGH.
3. All timing is the same for the left and right ports. Port 'A' may be either the left or right port. Port "B" is opposite from port "A".

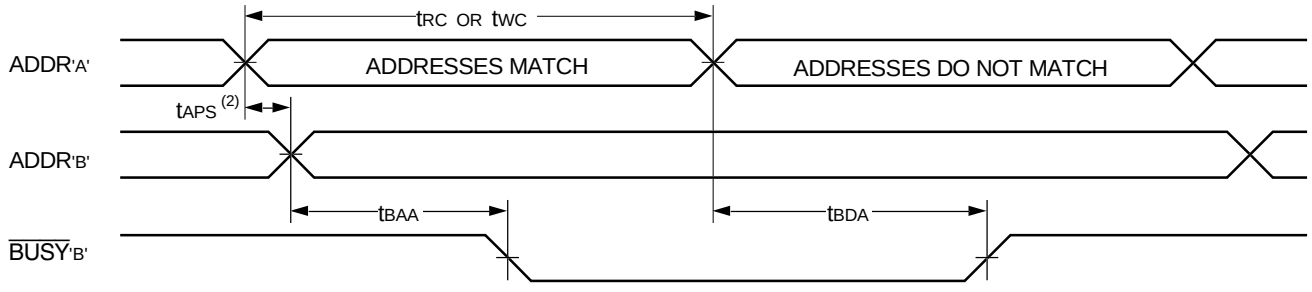
Timing Waveform of $\overline{BUSY}$ Arbitration Controlled by $\overline{CE}$ Timing(1)



3741 drw 12

NOTES:
1. All timing is the same for left and right ports. Port “A” may be either left or right port. Port “B” is the opposite from port “A”.
2. If t_{APS} is not satisified, the $\overline{BUSY}$ will be asserted on one side or the other, but there is no guarantee on which side $\overline{BUSY}$ will be asserted.

Timing Waveform of $\overline{BUSY}$ Arbitration Controlled Address Match Timing(1)



3741 drw 13

NOTES:
1. All timing is the same for left and right ports. Port “A” may be either left or right port. Port “B” is the opposite from port “A”.
2. If t_{APS} is not satisified, the $\overline{BUSY}$ will be asserted on one side or the other, but there is no guarantee on which side $\overline{BUSY}$ will be asserted.

L	L	MATCH	(2)	(2)	Write Inhibit(3)

3741 tbl 15

NOTES:
1. Pins $\overline{BUSY}_L$ and $\overline{BUSY}_R$ are both outputs for IDT71V30. $\overline{BUSY}_X$ outputs on the IDT71V30 are non-tristatable push-pull.
2. 'L' if the inputs to the opposite port were stable prior to the address and enable inputs of this port. 'H' if the inputs to the opposite port became stable after the address and enable inputs of this port. If t_{APS} is not met, either $\overline{BUSY}_L$ or $\overline{BUSY}_R$ = LOW will result. $\overline{BUSY}_L$ and $\overline{BUSY}_R$ outputs can not be LOW simultaneously.
3. Writes to the left port are internally ignored when $\overline{BUSY}_L$ outputs are driving LOW regardless of actual logic level on the pin. Writes to the right port are internally ignored when $\overline{BUSY}_R$ outputs are driving LOW regardless of actual logic level on the pin.

Functional Description

The IDT71V30 provides two ports with separate control, address and I/O pins that permit independent access for reads or writes to any location in memory. The IDT71V30 has an automatic power down feature controlled by CE. The CE controls on-chip power down circuitry that permits the respective port to go into a standby mode when not selected ($\overline{CE}$ = V_{IH}). When a port is enabled, access to the entire memory array is permitted.

Interrupts

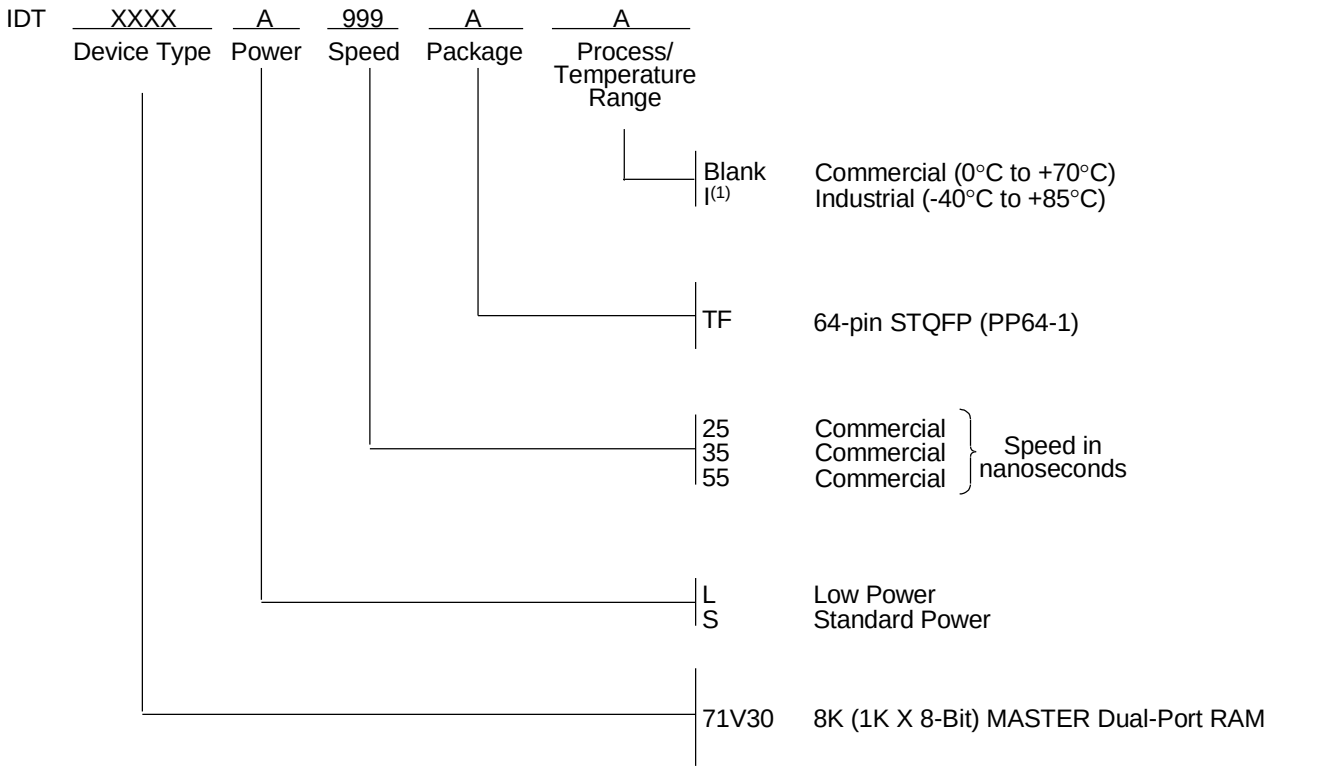
If the user chooses the interrupt function, a memory location (mail box or message center) is assigned to each port. The left port interrupt flag ($\overline{INT}_L$) is asserted when the right port writes to memory location 3FE (HEX), where a write is defined as the $\overline{CE}$ = R/$\overline{W}$ = V_{IL} per Truth Table II. The left port clears the interrupt by accessing address location 3FE access with $\overline{CE}_R$ = $\overline{OE}_R$ = V_{IL}, R/$\overline{W}$ is a "don't care". Likewise, the right port interrupt flag ($\overline{INT}_R$) is asserted when the left port writes to memory location 3FF (HEX) and to clear the interrupt flag ($\overline{INT}_R$), the right port must access the memory location 3FF. The message (8 bits) at 3FE or 3FF is user-defined, since it is an addressable SRAM location. If the interrupt function is not used, address locations 3FE and 3FF are not used as mail boxes, and are part of the random access memory. Refer to Table II for the interrupt operation.

Busy Logic

Busy Logic provides a hardware indication that both ports of the SRAM have accessed the same location at the same time. It also allows one of the two accesses to proceed and signals the other side that the SRAM is "Busy". The $\overline{BUSY}$ pin can then be used to stall the access until the operation on the other side is completed. If a write operation has been attempted from the side that receives a $\overline{BUSY}$ indication, the write signal is gated internally to prevent the write from proceeding.

The use of $\overline{BUSY}$ logic is not required or desirable for all applications. In some cases it may be useful to logically OR the $\overline{BUSY}$ outputs together and use any $\overline{BUSY}$ indication as an interrupt source to flag the event of an illegal or illogical operation.

Ordering Information



NOTE:
