## Dolby Pro Logic Processor Family

### 1. Introduction

The DPL 35xxA processor family is designed to decode Dolby encoded surround sound. The ICs integrate the complete Dolby Surround Pro Logic decoding on chip without any necessary external circuitry. This data sheet describes the features and specifications of all members of the IC family.

The DPL 3518A is designed as a coprocessor to one of the TV sound processing ICs of the MSP 34xx family. It only has digital interfaces. No analog input and output interfaces are supported.

The DPL 3519A is also designed as a coprocessor to the MSP family but has analog output channels in addition to the features of the DPL 3518A. Together with the MSP, a TV set with up to six outputs (L, R, C, SUB, S<sub>L</sub>, S<sub>R</sub>) can be developed together with headphones and several line outputs.

The DPL 3520A is designed as a stand-alone Dolby Surround Pro Logic decoder. An on-chip A/D converter digitizes analog inputs. The DPL 3520A can also be used as a coprocessor to the MSP 34xx single-chip Multistandard Sound Processor family. This gives another A/D input pair to the system.

The ICs of the DPL family are pin-compatible to the MSP ICs. This speeds up PCB development for customers using MSPs.

The software interface is largely the same as for the MSP 3400C. Volume, tone controls, matrixes and switches use the same registers and values. Thus, the standard MSP 3400C controlling software can be used to control the DPL 3520A. Little overhead is needed to control the Dolby Pro Logic part of the IC.

**DPL 3518A Integrated Functions:**

- Full Dolby Surround Pro Logic Adaptive Matrix
- Pseudo-surround mode for signals not encoded in Dolby Surround
- PANORAMA sound mode (3-D Surround sound via 2 loudspeakers)
- Noise sequencer
- Automatic input balance control
- 7 kHz low-pass filter
- 100 Hz low-pass filter for subwoofer
- Modified Dolby B-type NR decoder
- 30 ms surround delay according to table created by Dolby Laboratories (1 ms steps)
- 2 I<sup>2</sup>S input channels (e.g. MSP and DRPA)
- 2 I<sup>2</sup>S output channels, freely programmable with sound channels L/R (resp. L + C/R + C), C/S, Sub or I<sup>2</sup>S input
- Mode control: normal/phantom/wide/three channel/center off/panorama sound/stereo bypass
- Surround matrix mode control: adaptive/passive/effect
- Additional surround basewidth effect
- Reverberation of surround signals
- 2 digital input/output pins
- 1 digital input pin

**DPL 3519A Integrated Functions (in Addition to all DPL 3518A Functions):**

- Master volume control in dB units
- Level Trim for L, C, R, S in dB units,  $\pm 12$  dB
- Identical treble/bass/loudness function for L, C, R, S
- 5-band equalizer for C channel
- Separate volume control for two surround outputs
- Additional line output for HIFI receiver connection (SCART output). Volume for this output is in dB units.
- 3 pairs of D/A converters
- Scart switches

**DPL 3520A Integrated Functions (in Addition to all DPL 3518A and DPL 3519A Functions)**

- 1 pair of A/D converters
- Note: the 5-band equalizer for C channel can only be used in coprocessor mode. No parallel AD input possible.

**DPL 3520/19/18A Applications:**

Dolby Pro Logic Surround System  
 in television sets  
 in satellite receivers  
 in video recorders

**2. Functional Description**

In the following, the functional description of the DPL 3520A is given. See section 13 for the modified block diagrams of the DPL 3518A and DPL 3519A.

Block diagram: DPL 3520A consists of three blocks:

- analog input section containing channel selection and 2 high-quality A/D converters
- DSP section performing audio baseband processing
- analog output section containing 6 D/A converters with 4-fold oversampling

**Control-bus:**

- The IC is controlled by I<sup>2</sup>C-bus. The I<sup>2</sup>C-bus device addresses are 80<sub>hex</sub>/81<sub>hex</sub>, 84<sub>hex</sub>/85<sub>hex</sub> and 88<sub>hex</sub>/89<sub>hex</sub>.

**Clock System:**

- Single crystal clock system (18.432 MHz), alternatively external clock.

**Packages:**

- 68-pin PLCC package
- 64-pin Shrink DIP package
- 52-pin Shrink DIP package

**Power Consumption:**

- typical: 450 mW at 5V
- typical: 120 mW at 8V

**2.1. Features of the Analog Input Section**

- three selectable analog pairs of audio baseband inputs (= three SCART inputs)  
Input level: ≤ 2V RMS;  
input impedance: ≥ 25 kΩ
- one selectable analog mono input;  
Input level: ≤ 2V RMS;  
input impedance: ≥ 10 kΩ
- 20 Hz to 20 kHz Bandwidth for SCART-to-SCART-copy facilities
- two high-quality A/D converters

**2.2. Features of the DSP-Section**

- flexible selection of audio sources to be processed
- 4-channel digital input via I<sup>2</sup>S-Bus and 4-channel digital output via I<sup>2</sup>S-Bus.
- digital baseband processing: volume, bass, treble, loudness on output channels 1 and 2.
- Dolby Pro Logic processing
- 100 Hz low-pass for subwoofer
- 30 ms delay line

A block diagram of the DSP software is shown in Fig. 2-2.

Fig. 2-1: Block diagram of the DPL 3520A

Fig. 2–2: Firmware block diagram

**2.3. Features of the Analog Output Section**

- channel 1 and 2: two pairs of 4-fold oversampled D/A-converters  
 Output level per channel: max. 1.4 V<sub>RMS</sub>  
 Output resistance: max. 5 kΩ  
 S/N-Ratio: ≥ 85 dB at maximum volume; max. noise voltage in mute mode: ≤ 3 μV (BW: 20 Hz...16 kHz)
- one pair of four-fold oversampled D/A-converters supplying two selectable pairs of SCART-Outputs.  
 Output level per channel: max. 2 V<sub>RMS</sub>  
 Output resistance: max. 0.5 kΩ  
 S/N-Ratio: ≥ 85 dB (20 Hz ... 16 kHz)

**2.4. SCART Switches**

The analog input and output sections offer a wide range of switching facilities, which are shown in Fig. 2–3.

The switches are controlled by the ACB bits defined in the audio processing interface (see section 9. Programming the DSP Part).

If the DPL is switched off by first pulling STANDBYQ low, and then disconnecting the 5 V, but keeping the 8 V power supply ('Standby'-mode), the switches S1, S2, and S3 maintain their position and function. This facilitates the copying from selected SCART-inputs to SCART-outputs in the TV-sets standby mode.

Fig. 2–3: SCART-Switching Facilities  
 Bold lines determine the default configuration

In case of power-on start or starting from standby, the IC switches automatically to the default configuration, shown in Fig. 2–3. This takes place after the first I<sup>2</sup>C transmission into the DFP part. By transmitting the ACB register first, the default setting mode can be changed.

3. Specifications

3.1. Outline Dimensions

**Fig. 3-1:**  
 68-Pin Plastic Leaded Chip Carrier Package  
**(PLCC68)**  
 Weight approximately 4.8 g  
 Dimensions in mm

SPGS7004-3/4E

SPGS0016-4/2E

SPGS0015-1/2E

**Fig. 3-2:**  
 64-Pin Plastic Shrink Dual-Inline-Package  
**(PSDIP64)**  
 Weight approximately 9.0 g  
 Dimensions in mm

**Fig. 3-3:**  
 52-Pin Plastic Shrink Dual-Inline-Package  
**(PSDIP52)**  
 Weight approximately 5.5 g  
 Dimensions in mm

**3.2. Pin Connections and Short Descriptions**

NC = not connected; leave vacant  
 LV = if not used, leave vacant  
 DVSS: if not used, connect to DVSS

X = obligatory; connect as described in circuit diagram  
 AHVSS: connect to AHVSS  
 20/19: pin description valid for DPL 3520A and DPL 3519A  
 18: pin description valid for DPL 3518A

### 3.5. Electrical Characteristics

#### 3.5.1. Absolute Maximum Ratings

Symbol	Parameter	Pin Name	Min.	Max.	Unit
$T_A$	Ambient Operating Temperature	–	0	70	°C
$T_S$	Storage Temperature	–	–40	125	°C
$V_{SUP1}$	First Supply Voltage	AHVSUP	–0.3	9.0	V
$V_{SUP2}$	Second Supply Voltage	DVSUP	–0.3	6.0	V
$V_{SUP3}$	Third Supply Voltage	AVSUP	–0.3	6.0	V
$dV_{SUP23}$	Voltage between AVSUP and DVSUP	AVSUP, DVSUP	–0.5	0.5	V
$P_{TOT}$	Chip Power Dissipation PLCC68 without Heat Spreader	AHVSUP, DVSUP, AVSUP		1100	mW
$V_{Idig}$	Input Voltage, all Digital Inputs		–0.3	$V_{SUP2}+0.3$	V
$I_{Idig}$	Input Current, all Digital Pins	–	–20	+20	mA <sup>1)</sup>
$V_{Iana}$	Input Voltage, all Analog Inputs	SCn_IN_s, <sup>2)</sup> MONO_IN	–0.3	$V_{SUP1}+0.3$	V
$I_{Iana}$	Input Current, all Analog Inputs	SCn_IN_s, <sup>2)</sup> MONO_IN	–5	+5	mA <sup>1)</sup>
$I_{Oana}$	Output Current, all SCART Outputs	SCn_OUT_s <sup>2)</sup>	3), 4)	3), 4)	
$I_{Oana}$	Output Current, all Analog Outputs except SCART Outputs	DACp_s <sup>2)</sup>	3)	3)	
$I_{Cana}$	Output Current, other pins connected to capacitors	CAPL_p, <sup>2)</sup> AGNDC	3)	3)	

1) positive value means current flowing into the circuit  
2) “n” means “1”, “2” or “3”, “s” means “L” or “R”, “p” means “C1” or “C2”  
3) The Analog Outputs are short circuit proof with respect to First Supply Voltage and Ground.  
4) Total chip power dissipation must not exceed absolute maximum rating.

Stresses beyond those listed in the “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only. Functional operation of the device at these or any other conditions beyond those indicated in the “Recommended Operating Conditions/Characteristics” of this specification is not implied. Exposure to absolute maximum ratings conditions for extended periods may affect device reliability.

### 3.5.2. Recommended Operating Conditions

at  $T_A = 0$  to  $70$  °C

Symbol	Parameter	Pin Name	Min.	Typ.	Max.	Unit
$V_{SUP1}$	First Supply Voltage	AHVSUP	7.6	8.0	8.4	V
$V_{SUP2}$	Second Supply Voltage	DVSUP	4.75	5.0	5.25	V
$V_{SUP3}$	Third Supply Voltage	AVSUP	4.75	5.0	5.25	V
$V_{REIL}$	RESET Input Low Voltage	RESETQ			0.45	$V_{SUP2}$
$V_{REIH}$	RESET Input High Voltage		0.8			$V_{SUP2}$
$t_{REIL}$	RESET Low Time after DVSUP Stable and Oscillator Startup		5			$\mu$ s
$V_{DIGIL}$	Digital Input Low Voltage	STANDBYQ, ADR_SEL, TESTEN, D_CTR_IN, D_CTR_IO_0/1			0.25	$V_{SUP2}$
$V_{DIGIH}$	Digital Input High Voltage		0.75			$V_{SUP2}$
$t_{STBYQ1}$	STANDBYQ Setup Time before Turn-off of Second Supply Voltage	STANDBYQ, DVSUP	1			$\mu$ s
<b>I<sup>2</sup>C-Bus Recommendations</b>						
$V_{IMIL}$	I <sup>2</sup> C-BUS Input Low Voltage	I <sup>2</sup> C_CL, I <sup>2</sup> C_DA			0.3	$V_{SUP2}$
$V_{IMIH}$	I <sup>2</sup> C-BUS Input High Voltage		0.6			$V_{SUP2}$
$f_{IM}$	I <sup>2</sup> C-BUS Frequency	I <sup>2</sup> C_CL			1.0	MHz
$t_{I2C1}$	I <sup>2</sup> C START Condition Setup Time	I <sup>2</sup> C_CL, I <sup>2</sup> C_DA	120			ns
$t_{I2C2}$	I <sup>2</sup> C STOP Condition Setup Time		120			ns
$t_{I2C3}$	I <sup>2</sup> C-Clock Low Pulse Time	I <sup>2</sup> C_CL	500			ns
$t_{I2C4}$	I <sup>2</sup> C-Clock High Pulse Time		500			ns

<p>1) "n" means "1", "2" or "3", "s" means "L" or "R", "p" means "C1" or "C2"</p> <p>2) External capacitors at each crystal pin to ground are required. They are necessary to tune the open-loop frequency of the internal PLL and to stabilize the frequency in closed-loop operation. The higher the capacitors, the lower the clock frequency results. The nominal free running frequency should match 18.432 MHz as closely as possible. Due to different layouts of customer PCBs, the matching capacitor size should be defined in the application. The suggested values (1.5 pF/3.3 pF) are figures based on experience with various PCB layouts.</p>						

### 3.5.3. Characteristics

at  $T_A = 0$  to  $70$  °C,  $f_{\text{CLOCK}} = 18.432$  MHz,  $V_{\text{SUP1}} = 7.6$  to  $8.4$  V,  $V_{\text{SUP2,3}} = 4.75$  to  $5.25$  V for min./max. values

(Typical values are measured at  $T_A = 25$  °C,  $AHVSUP = 8$  V,  $DVSUP = 5$  V,  $AVSUP = 5$  V.)

#### 4. I<sup>2</sup>C-Bus Interface

As a slave receiver, the DPL can be controlled via I<sup>2</sup>C-bus. Access to internal memory locations is achieved by subaddressing. The MODE\_REG, the CONTROL register and the DFP processor have separate subaddressing register banks.

In order to allow for more DPL or MSP ICs to be connected to the control bus, an ADR\_SEL pin was implemented. With ADR\_SEL pulled to high, low, or left open, the DPL responds to changed device addresses. Thus, three identical devices can be selected.

By means of the RESET bit in the CONTROL register, all devices with the same device address are reset.

The IC is selected by asserting a special device address in the address part of an I<sup>2</sup>C-transmission. A device address pair is defined as a write address (80 hex, 84 hex, or 88 hex) and a read address (81 hex, 85 hex, or 89 hex). Writing is done by sending the device write address first, followed by the subaddress byte, two address bytes, and two data bytes. For reading, the read address has to be transmitted first by sending the device write address (80 hex, 84 hex, or 88 hex), followed by the subaddress byte and two address bytes. Without sending a stop condition, reading of the addressed data is

done by sending the device read address (81 hex, 85 hex, or 89 hex) and reading two bytes of data. Refer to Fig. 4-1: I<sup>2</sup>C-Bus Protocol and section 4.2.: Proposal for DPL I<sup>2</sup>C-Telegrams.

Due to the internal architecture of the DPL, the IC cannot react immediately to an I<sup>2</sup>C request. The typical response time is about 0.3 ms. If the receiver (DPL) cannot receive another complete byte of data until it has performed some other function, it can hold the clock line I<sup>2</sup>C\_CL LOW to force the transmitter into a wait state. The positions within a transmission where this may happen are indicated by 'Wait' in section 4.1. The maximum wait period of the DPL during normal operation mode is less than 1 ms.

I<sup>2</sup>C-Bus error conditions:

If an internal error occurs, the DPLs wait period is extended to a maximum of 1.8 ms. Afterwards, the DPL does not acknowledge (NAK) the device address. The data line will be left HIGH by the DPL and the clock line will be released. The master can then generate a STOP condition to abort the transfer.

By means of NAK, the master is able to recognize the error state and to reset the IC via I<sup>2</sup>C-Bus. While transmitting the reset protocol (see 4.1.) to 'CONTROL', the master must ignore the 'Not Acknowledge Bits' (NAK) of the DPL.

**Table 4-1:** I<sup>2</sup>C-Bus Device and Subaddresses

Name	Binary Value	Hex Value	Hex Value	Hex Value	Mode	Function

Read from DFP or MODE\_REG

Write to the Control Register

**Note:** S = I<sup>2</sup>C-Bus Start Condition from master  
 P = I<sup>2</sup>C-Bus Stop Condition from master  
 ACK = Acknowledge-Bit: LOW on I<sup>2</sup>C\_DA from slave (=DPL, grey) or master (=CCU, hatched)  
 NAK = Not Acknowledge-Bit: HIGH on I<sup>2</sup>C\_DA from master (=CCU, hatched) to indicate 'End of Read' or from DPL indicating internal error state  
 Wait = I<sup>2</sup>C-Clock line held low by the slave (=DPL) while interrupt is serviced (<1 ms)

Fig. 4-1: I<sup>2</sup>C-bus protocol (MSB first; data must be stable while clock is high)

 > Stop Condition  
 aa Address Byte  
 dd Data Byte

4.2.2. Write Telegrams

<daw 00 dd dd> software RESET  
 <daw 10 aa aa dd dd> write data into MODE\_REG register  
 <daw 12 aa aa dd dd> write data into DFP register

4.2.3. Read Telegrams

<daw 11 aa aa <dar dd dd> read data from MODE\_REG register  
 <daw 13 aa aa <dar dd dd> read data from DFP register

4.2.4. Examples

<80 00 80 00> RESET DPL statically  
 <80 00 00 00> clear RESET  
 <80 12 00 08 03 20> set channel source 1 to DOLBYLR and Matrix to STEREO

4.3. Start-Up Sequence

After power on or RESET, the IC is in an inactive state. The CCU has to transmit the required coefficient set for a given operation via the I<sup>2</sup>C-bus.

## 5. Audio PLL and Crystal Specifications

### 5.1. Operation with Crystal

The DPL requires a 18.432 MHz (12 pF, parallel) crystal. The clock supply of the whole system depends on the DPL operation mode:

1. Stand-Alone

The system clock runs free on the crystal's 18.432 MHz.

2. I<sup>2</sup>S slave operation:

In this case, the system clock is locked to a synchronizing signal (I2S\_WS) supplied by the coprocessor chip.

**Remark on using the crystal:**

External capacitors are required at each crystal pin to ground. They are necessary for tuning the open-loop frequency of the internal PLL and for stabilizing the frequency in closed-loop operation. The higher the capacitors, the lower the clock frequency results. The nominal free running frequency should match the center of the tolerance range between 18.433 and 18.431 MHz as closely as possible.

### 5.2. Operation without Crystal

When used together with a member of the MSP family, the DPL can be driven by the 18.432 MHz clock supplied by the MSP. The clock input is: XTAL\_IN (connection via coupling capacitor (C>1nF)). No crystal is used in this mode.

## 6. I<sup>2</sup>S-Bus Interface

By means of this standardized interface, additional feature processors can be connected to the DPL. Two possible formats are supported: The standard mode (MODE\_REG[4]=0) selects the SONY format, where the I2S\_WS signal changes at the word boundaries. The so-called PHILIPS format, which is characterized by a change of the I2S\_WS signal one I2S\_CL period before the word boundaries, is selected by setting MODE\_REG[4]=1.

The DPL normally serves as the slave on the I<sup>2</sup>S interface (default setting after power-up). I<sup>2</sup>S-clock and word strobe lines are input to the DPL and the master clock is synchronized to 576 times the I2S\_WS rate (32 kHz). By setting MODE\_REG[3]=0, the DPL is switched to Master Mode. Now, these lines are input to the DPL and the master clock is synchronized to 576 times the I2S\_WS rate (32 kHz).

The I<sup>2</sup>S-bus interface consists of six pins:

1. I2S\_DA\_IN1, I2S\_DA\_IN2:

For input, four channels (two channels per line, 2 × 16 bits) per sampling cycle (32 kHz) are transmitted.

2. I2S\_DA\_OUT1, I2S\_DA\_OUT2:

For output, four channels (two channels per line, 2 × 16 bits) per sampling cycle (32 kHz) are transmitted.

3. I2S\_CL:

Gives the timing for the transmission of I<sup>2</sup>S serial data (1.024 MHz).

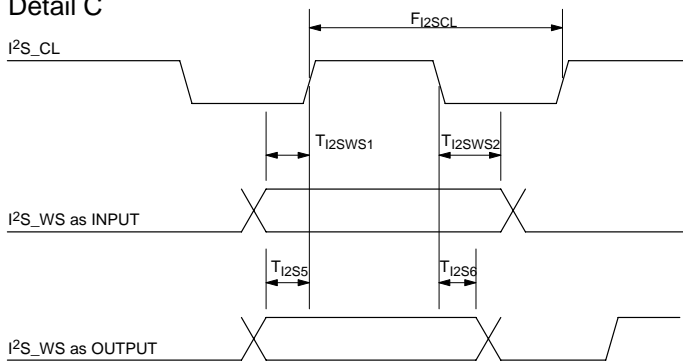

4. I2S\_WS:

The I2S\_WS word strobe line defines the left and right sample.

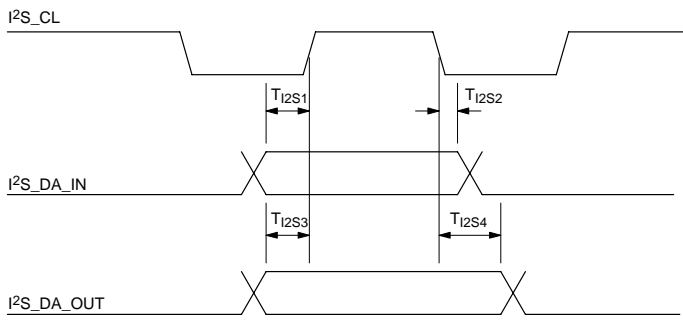

6.1. I<sup>2</sup>S Bus Timing Diagram

Detail C

Detail A,B

### 7. Power-up Sequence

The reset pin should not be high ( $>0.45 \text{ DVSUP}$ , see recommended operation conditions) before the 5 Volt digital powersupply (DVSUP) is  $>4.75 \text{ Volt}$  **and** the DPL-Clock is running (Delay: 1 ms max, 0.5 ms typ.).

This means, if the reset low-high edge starts with a delay of 2 ms after  $\text{DVSUP} > 4.75 \text{ Volt}$ , even under worst case conditions, the reset is ok.

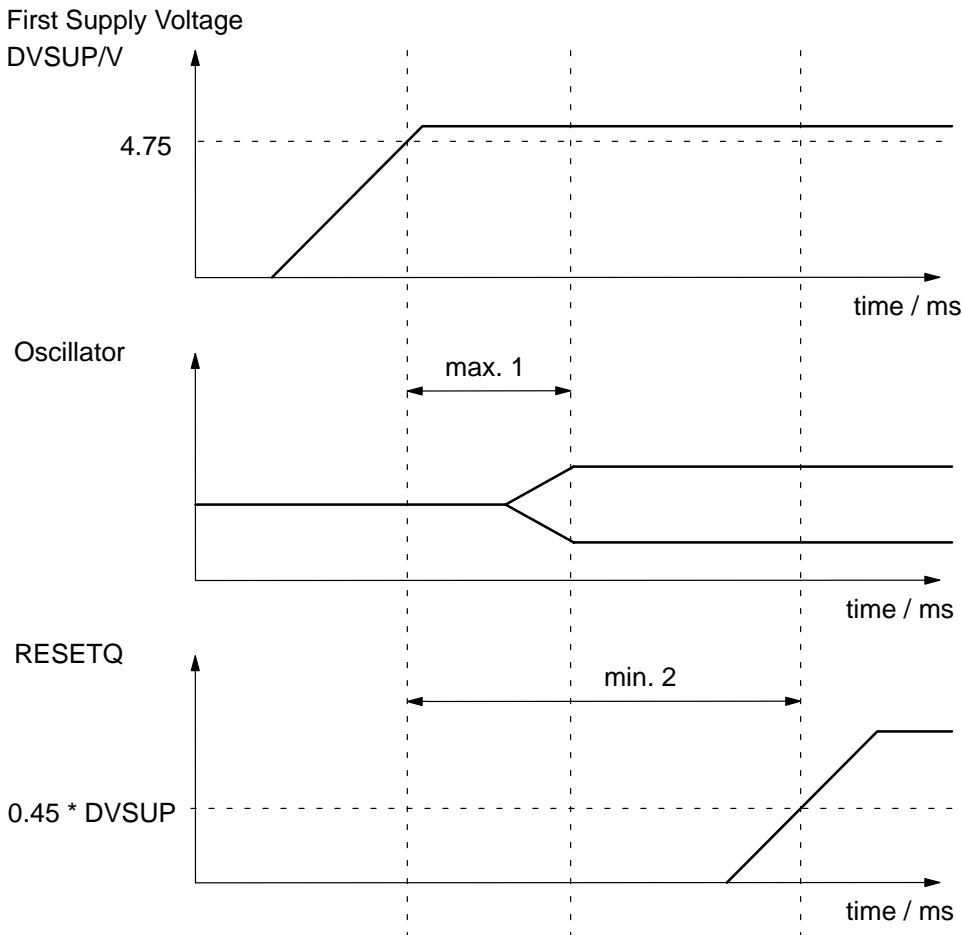

Fig. 7-1: Power-up sequence

## 8. Programming the Mode Register

All transmissions on the control bus are 16 bits wide.

**Table 8–1:** DPL mode register

Register	Write Address (hex)	Function
MODE_REG	0083	mode register

The register 'MODE\_REG' contains the control bits determining the operation mode of the DPL; Table 8–2 explains all bit positions.

**Table 8–2:** Control word 'MODE\_REG'

MODE_REG 0083 <sub>hex</sub>					
Bit	Function	Comment	Definition	Reset condition	Recommendation
[0]	not used			0	0
[1]	DCTR_TRI	Digital control IO 0/1 tristate	0 : active 1 : tristate	1	0
[2]	I2S_TRI	I <sup>2</sup> S outputs tristate (I2S_CL, I2S_WS, I2S_DA_OUT)	0 : active 1 : tristate	1	0
[3]	I2S_MODE	Master/Slave mode of the I <sup>2</sup> S-bus	0 : Master 1 : Slave	1	X
[4]	I2S_WS_MODE	WS due to the Sony or Philips-Format	0 : Sony 1 : Philips	0	X
[5]	AUDIO_CL_OUT	Switch Audio_Clock_Output to tristate	0 : on 1 : tristate	0	X
[15:6]	not used			0	0

## 9. Programming the DSP Part

### 9.1. Summary of the DSP Control Registers

Control registers are 16 bits wide. Transmissions via I<sup>2</sup>C-bus have to take place in 16-bit words. Single data entries are 8-bit. Some of the defined 16-bit words are divided into low and high byte, thus holding two different control entities. All control registers are readable.

**Note:** Unused parts of the 16-bit registers must be zero.

**Table 9–1:** Summary of the DSP Control Registers

Name	I <sup>2</sup> C Bus Address	High /Low	Adjustable Range, Operational Modes	Reset Mode	Valid for
Standard MSP like Control Registers					
Volume channel 1	0000 <sub>hex</sub>	H	[+12 dB ... –114 dB, MUTE]	MUTE	19/20

<sup>\*)</sup> Equalizing function only for SOUNDA (=Center) possible. Equalizer and AD input cannot work simultaneously. In the DPL 3520A the equalizer can only be used in coprocessor mode (input via I<sup>2</sup>C and not via AD converter).

### 9.1.1. Volume Channel 1 and Channel 2

<b>Volume Channel 1</b>	<b>0000<sub>hex</sub></b> <b>11 MSBs</b> <b>(DPL 3519/20)</b>
<b>Volume Channel 2</b>	<b>0006<sub>hex</sub></b> <b>11 MSBs</b> <b>(DPL 3519/20)</b>
+12 dB	0111 1111 000x 7F0 <sub>hex</sub>
+11.875 dB	0111 1110 111x 7EE <sub>hex</sub>
+0.125 dB	0111 0011 001x 732 <sub>hex</sub>
0 dB	0111 0011 000x 730 <sub>hex</sub>
-0.125 dB	0111 0010 111x 72E <sub>hex</sub>
-114.125 dB	0000 0001 001x 012 <sub>hex</sub>
-114 dB	0000 0001 000x 010 <sub>hex</sub>
Mute	0000 0000 xxxx 00x <sub>hex</sub> RESET
Fast Mute	1111 1111 111x FFE <sub>hex</sub>

The highest given positive 11-bit number (7F0<sub>hex</sub>) yields in a maximum possible gain of 12 dB. Decreasing the volume register by 1 LSB decreases the volume by 0.125 dB. Volume settings lower than the given minimum mute the output. With large scale input signals, positive volume settings may lead to signal clipping.

With Fast Mute, volume is reduced to mute position by digital volume only. Analog volume is not changed. This reduces any audible DC plops. Going back from Fast Mute should be done to the volume step before Fast Mute was activated.

<b>Clipping Mode Channel 1</b>	<b>0000<sub>hex</sub></b> <b>3 LSBs</b> <b>(DPL 3519/20)</b>
<b>Clipping Mode Channel 2</b>	<b>0006<sub>hex</sub></b> <b>3 LSBs</b> <b>(DPL 3519/20)</b>
Reduce Volume	x000      0 <sub>hex</sub> RESET
Reduce Tone Control	x001      1 <sub>hex</sub>
Compromise Mode	x010      2 <sub>hex</sub>

If the clipping mode is set to “Reduce Volume”, the following clipping procedure is used: To prevent severe clipping effects with bass, treble, or equalizer boosts, the internal volume is automatically limited to a level where, in combination with either bass, treble, or equalizer setting, the amplification does not exceed 12 dB.

If the clipping mode is “Reduce Tone Control”, the bass or treble value is reduced if amplification exceeds 12 dB. If the equalizer is switched on, the gain of those bands is reduced, where amplification together with volume exceeds 12 dB.

If the clipping mode is “Compromise Mode”, the bass or treble value and volume are both reduced by half, if amplification exceeds 12 dB. If the equalizer is switched on, the gain of those bands is reduced by half, where amplification together with volume exceeds 12 dB.

<b>Example:</b>	<b>Vol.: +6 dB</b>	<b>Bass: +9 dB</b>	<b>Treble: +5 dB</b>
Reduce Volume	3	9	5
Reduce Tone Control	6	6	5
Compromise	4.5	7.5	5

### 9.1.2. Balance Channel 1 and Channel 2

Positive balance settings reduce the left channel without affecting the right channel; negative settings reduce the right channel leaving the left channel unaffected. In linear mode, a step by 1 LSB decreases or increases the balance by about 0.8% (exact figure: 100/127). In logarithmic mode, a step by 1 LSB decreases or increases the balance by 1 dB.

<b>Balance Mode Channel 1</b>	<b>0001<sub>hex</sub></b> <b>LSB</b> <b>(DPL 3519/20)</b>
<b>Balance Mode Channel 2</b>	<b>0030<sub>hex</sub></b> <b>LSB</b> <b>(DPL 3519/20)</b>

Left 100%, Right 100%	0000 0000 RESET	00 <sub>hex</sub>
Left 100%, Right 99.2%	1111 1111	FF <sub>hex</sub>
Left 100%, Right 0.8%	1000 0010	82 <sub>hex</sub>
Left 100%, Right muted	1000 0001	81 <sub>hex</sub>

<b>Balance Channel 1 [L/R]</b>	<b>0001<sub>hex</sub></b>	<b>H</b>
	<b>(DPL 3519/20)</b>	
<b>Balance Channel 2 [L/R]</b>	<b>0030<sub>hex</sub></b>	<b>H</b>
	<b>(DPL 3519/20)</b>	
Left -127 dB, Right 0 dB	0111 1111	7F <sub>hex</sub>
Left -126 dB, Right 0 dB	0111 1110	7E <sub>hex</sub>
Left -1 dB, Right 0 dB	0000 0001	01 <sub>hex</sub>
Left 0 dB, Right 0 dB	0000 0000 RESET	00 <sub>hex</sub>
Left 0 dB, Right -1 dB	1111 1111	FF <sub>hex</sub>
Left 0 dB, Right -127 dB	1000 0001	81 <sub>hex</sub>
Left 0 dB, Right -128 dB	1000 0000	80 <sub>hex</sub>

9.1.3. Bass Channel 1 and Channel 2

<b>Bass Channel 1</b>	<b>0002<sub>hex</sub></b>	<b>H</b>
	<b>(DPL 3519/20)</b>	
<b>Bass Channel 2</b>	<b>0031<sub>hex</sub></b>	<b>H</b>
	<b>(DPL 3519/20)</b>	
+20 dB	0111 1111	7F <sub>hex</sub>
+18 dB	0111 1000	78 <sub>hex</sub>
+16 dB	0111 0000	70 <sub>hex</sub>
+14 dB	0110 1000	68 <sub>hex</sub>
+12 dB	0110 0000	60 <sub>hex</sub>
+11 dB	0101 1000	58 <sub>hex</sub>
+1 dB	0000 1000	08 <sub>hex</sub>
+1/8 dB	0000 0001	01 <sub>hex</sub>
0 dB	0000 0000 RESET	00 <sub>hex</sub>
-1/8 dB	1111 1111	FF <sub>hex</sub>
-1 dB	1111 1000	F8 <sub>hex</sub>
-11 dB	1010 1000	A8 <sub>hex</sub>
-12 dB	1010 0000	A0 <sub>hex</sub>

With positive bass settings, internal overflow may occur even with overall volume less than 0 dB. This will lead to a clipped output signal. Therefore, it is not recommended to set bass to a value that, in conjunction with volume, would result in an overall positive gain.

Loudspeaker channel: Bass and Equalizer cannot work simultaneously (see Table: Mode Tone Control). If Equalizer is used, Bass and Treble coefficients must be set to zero and vice versa.

## 9.1.4. Treble Channel 1 and Channel 2

<b>Treble Channel 1</b>	<b>0003<sub>hex</sub></b>	<b>H</b>
	<b>(DPL 3519/20)</b>	
<b>Treble Channel 2</b>	<b>0032<sub>hex</sub></b>	<b>H</b>
	<b>(DPL 3519/20)</b>	
+15 dB	0111 1000	78 <sub>hex</sub>
+14 dB	0111 0000	70 <sub>hex</sub>
+1 dB	0000 1000	08 <sub>hex</sub>
+1/8 dB	0000 0001	01 <sub>hex</sub>
0 dB	0000 0000 RESET	00 <sub>hex</sub>
-1/8 dB	1111 1111	FF <sub>hex</sub>
-1 dB	1111 1000	F8 <sub>hex</sub>
-11 dB	1010 1000	A8 <sub>hex</sub>
-12 dB	1010 0000	A0 <sub>hex</sub>

With positive treble settings, internal overflow may occur even with overall volume less than 0 dB. This will lead to a clipped output signal. Therefore, it is not recommended to set treble to a value that, in conjunction with volume, would result in an overall positive gain.

Loudspeaker channel: Treble and Equalizer cannot work simultaneously (see Table: Mode Tone Control). If Equalizer is used, Bass and Treble coefficients must be set to zero and vice versa.

## 9.1.5. Loudness Channel 1 and Channel 2

<b>Loudness Channel 1</b>	<b>0004<sub>hex</sub></b>	<b>H</b>
	<b>(DPL 3519/20)</b>	
<b>Loudness Channel 2</b>	<b>0033<sub>hex</sub></b>	<b>H</b>
	<b>(DPL 3519/20)</b>	
+17 dB	0100 0100	44 <sub>hex</sub>
+16 dB	0100 0000	40 <sub>hex</sub>
+1 dB	0000 0100	04 <sub>hex</sub>
0 dB	0000 0000 RESET	00 <sub>hex</sub>

<b>Mode Loudness Channel 1</b>	<b>0004<sub>hex</sub></b>	<b>L</b>
	<b>(DPL 3519/20)</b>	
<b>Mode Loudness Channel 2</b>	<b>0033<sub>hex</sub></b>	<b>L</b>
	<b>(DPL 3519/20)</b>	
Normal (constant volume at 1 kHz)	0000 0000 RESET	00 <sub>hex</sub>
Super Bass (constant volume at 2 kHz)	0000 0100	04 <sub>hex</sub>

Loudness increases the volume of low and high frequency signals, while keeping the amplitude of the 1 kHz reference frequency constant. The intended loudness has to be set according to the actual volume setting. Because loudness introduces gain, it is not recommended to set loudness to a value that, in conjunction with volume, would result in an overall positive gain.

By means of 'Mode Loudness', the corner frequency for bass amplification can be set to two different values. In Super Bass mode, the corner frequency is shifted up. The point of constant volume is shifted from 1 kHz to 2 kHz.

### 9.1.6. Spatial Effects Channel 1

Spatial Effect Strength Channel 1	0005 <sub>hex</sub> (DPL 3519/20)	H
Enlargement 100%	0111 1111	7F <sub>hex</sub>
Enlargement 50%	0011 1111	3F <sub>hex</sub>
Enlargement 1.5%	0000 0001	01 <sub>hex</sub>
Effect off	0000 0000 RESET	00 <sub>hex</sub>
Reduction 1.5%	1111 1111	FF <sub>hex</sub>
Reduction 50%	1100 0000	C0 <sub>hex</sub>
Reduction 100%	1000 0000	80 <sub>hex</sub>

Spatial Effect Mode Channel 1	0005 <sub>hex</sub> (H nibble) (DPL 3519/20)	L
Stereo Basewidth Enlargement (SBE) and Pseudo Stereo Effect (PSE). (Mode A)	0000 RESET 0000	0 <sub>hex</sub> 0 <sub>hex</sub>
Stereo Basewidth Enlargement (SBE) only. (Mode B)	0010	2 <sub>hex</sub>

Spatial Effect Customize Coefficient Channel 1	0005 <sub>hex</sub> (L nibble) (DPL 3519/20)	L
max high pass gain	0000 RESET	0 <sub>hex</sub>
2/3 high pass gain	0010	2 <sub>hex</sub>
1/3 high pass gain	0100	4 <sub>hex</sub>
min. high pass gain	0110	6 <sub>hex</sub>
automatic	1000	8 <sub>hex</sub>

There are several spatial effect modes available:

Mode A (low byte = 00<sub>hex</sub>) is compatible to the formerly used spatial effect. Here, the kind of spatial effect depends on the source mode. If the incoming signal is in mono mode, Pseudo Stereo Effect is active; for stereo signals, Pseudo Stereo Effect and Stereo Basewidth Enlargement is effective. The strength of the effect is controllable by the upper byte. A negative value reduces the stereo image. A rather strong spatial effect is recommended for small TV sets where loudspeaker spacing is rather close. For large-screen TV sets, a more moderate spatial effect is recommended. In mode A, even in case of stereo input signals, Pseudo Stereo Effect is active, which reduces the center image.

In Mode B, only Stereo Basewidth Enlargement is effective. For mono input signals, the Pseudo Stereo Effect has to be switched on.

It is worth mentioning that all spatial effects affect amplitude and phase response. With the lower 4 bits, the frequency response can be customized. A value of 0000<sub>bin</sub> yields a flat response for center signals (L = R) but a high pass function of L or R only signals. A value of 0110<sub>bin</sub> has a flat response for L or R only signals but a lowpass function for center signals. By using 1000<sub>bin</sub>, the frequency response is automatically adapted to the sound material by choosing an optimal high pass gain.

## 9.1.7. Volume SCART Channel

Linear Mode		
Volume SCART	0007 <sub>hex</sub> (DPL 3519/20)	H
OFF	0000 0000 RESET	00 <sub>hex</sub>
0 dB gain (digital full scale (FS) to 2 V <sub>RMS</sub> output)	0100 0000	40 <sub>hex</sub>
+6 dB gain (–6 dBFS to 2 V <sub>RMS</sub> output)	0111 1111	7F <sub>hex</sub>

Logarithmic Mode		
Volume SCART	0007 <sub>hex</sub> (DPL 3519/20)	11 MSBs
+12 dB	0111 1111 000x	7F0 <sub>hex</sub>
+11.875 dB	0111 1110 111x	7EE <sub>hex</sub>
+0.125 dB	0111 0011 001x	732 <sub>hex</sub>
0 dB	0111 0011 000x	730 <sub>hex</sub>
–0.125 dB	0111 0010 111x	72E <sub>hex</sub>
–114.125 dB	0000 0001 001x	012 <sub>hex</sub>
–114 dB	0000 0001 000x	010 <sub>hex</sub>
Mute	0000 0000 0000 RESET	000 <sub>hex</sub>

Volume Mode SCART	0007 <sub>hex</sub> (DPL 3519/20)	LSB
linear	xxx0 RESET	0 <sub>hex</sub>
logarithmic	xxx1	1 <sub>hex</sub>

## 9.1.8. Channel Source Modes

Channel 1 source	0008 <sub>hex</sub> (DPL 3519/20)	H
Channel 2 source	0009 <sub>hex</sub> (DPL 3519/20)	H
SCART source	000a <sub>hex</sub> (DPL 3519/20)	H
I <sup>2</sup> S1 source	000b <sub>hex</sub> (DPL 3518/19/20)	H
I <sup>2</sup> S2 source	0038 <sub>hex</sub> (DPL 3518/19/20)	H
Quasi-peak detector source	000c <sub>hex</sub> (DPL 3518/19/20)	H
SCART (20)	0000 0010	02 <sub>hex</sub>
DOLBYLR (18/19/20)	0000 0011	03 <sub>hex</sub>
DOLBYCS (18/19/20)	0000 0100	04 <sub>hex</sub>
I <sup>2</sup> S1 (18/19/20)	0000 0101	05 <sub>hex</sub>
I <sup>2</sup> S2 (18/19/20)	0000 0110	06 <sub>hex</sub>
DOLBYCSUB (18/19/20)	0000 0111	07 <sub>hex</sub>

DOLBYLR denotes a signal pair consisting of surround decoder output for the left and right loudspeakers. The signal content depends on the used surround reproduction mode. DOLBYCS is the signal pair for the center and surround information (if there is any, depending on the surround reproduction mode). DOLBYCSUB is a signal pair consisting of the center information and a subwoofer channel. The subwoofer channel is the sum of all low frequency components (fg=100Hz) of the L, R and C channels.

**The I<sup>2</sup>S2 source must not be 00<sub>hex</sub>. It should be one of the mentioned values, otherwise the SCART source will not work properly.**

**If the equalizer is switched on, SCART as source is no longer valid, i.e. AD input is no longer possible.**

### 9.1.9. Channel Matrix Modes

Channel 1 matrix	0008 <sub>hex</sub> (DPL 3519/20)	L
Channel 2 matrix	0009 <sub>hex</sub> (DPL 3519/20)	L
SCART matrix	000a <sub>hex</sub> (DPL 3519/20)	L
I <sup>2</sup> S1 matrix	000b <sub>hex</sub> (DPL 3518/19/20)	L
I <sup>2</sup> S2 matrix	0038 <sub>hex</sub> (DPL 3518/19/20)	L
Quasi-peak detector matrix	000c <sub>hex</sub> (DPL 3518/19/20)	L
SOUNDA, LEFT or CENTER	0000 0000 RESET	00 <sub>hex</sub>
SOUNDB, RIGHT, SURROUND or SUB-WOOFER	0001 0000	10 <sub>hex</sub>
STEREO	0010 0000	20 <sub>hex</sub>
MONO	0011 0000	30 <sub>hex</sub>
SUM/DIFF	0100 0000	40 <sub>hex</sub>
AB_XCHANGE	0101 0000	50 <sub>hex</sub>
PHASE_CHANGE_B	0110 0000	60 <sub>hex</sub>
PHASE_CHANGE_A	0111 0000	70 <sub>hex</sub>
A_ONLY	1000 0000	80 <sub>hex</sub>
B_ONLY	1001 0000	90 <sub>hex</sub>
INV_STEREO	1111 0000	F0 <sub>hex</sub>

The sum/difference mode can be used together with the quasi-peak detector to determine the sound material mode. If the difference signal on channel B (right) is near to zero, and the sum signal on channel A (left) is high, the incoming audio signal is mono. If there is a significant level on the difference signal, the incoming audio is stereo.

The inv\_stereo mode can be used to phase invert outputs via the I<sup>2</sup>S interfaces. This gives the option to correct phase relations with outputs of attached processors.

### 9.1.10. SCART Prescale

Volume Prescale SCART	000d <sub>hex</sub> (DPL 3520)	H
OFF	0000 0000 RESET	00 <sub>hex</sub>
0 dB gain (2 V <sub>RMS</sub> input to digital full scale)	0001 1001	19 <sub>hex</sub>
+14 dB gain (400 mV <sub>RMS</sub> input to digital full scale)	0111 1111	7F <sub>hex</sub>

### 9.1.11. I<sup>2</sup>S1 and I<sup>2</sup>S2 Prescale

Volume Prescale I <sup>2</sup> S1	0016 <sub>hex</sub> (DPL 3518/19/20)	H
OFF	00 <sub>hex</sub>	
0 dB gain	10 <sub>hex</sub> RESET	
+18 dB gain	7F <sub>hex</sub>	

### 9.1.12. ACB Register, Definition of the SCART-Switches and DIG\_CTR\_OUT Pins

ACB Register	0013 <sub>hex</sub> (DPL 3519/20)	H
DFP In Selection SCART1_IN MONO_IN SCART2_IN SCART3_IN	xxxx xx00 xxxx xx01 xxxx xx10 xxxx xx11	RESET
SCART1_OUT Selection SCART3_IN SCART2_IN MONO_IN DA_SCART	xxxx 00xx xxxx 01xx xxxx 10xx xxxx 11xx	RESET
SCART2_OUT Selection DA_SCART SCART1_IN MONO_IN	xx00 xxxx xx01 xxxx xx10 xxxx	RESET
DIG_CTR_OUT1 low high	x0xx xxxx x1xx xxxx	RESET
DIG_CTR_OUT2 low high	0xxx xxxx 1xxx xxxx	RESET
RESET: The RESET state is taken at the time of the first write transmission on the control bus to the audio processing part (DFP). By writing to the ACB register first, the RESET state can be redefined.		

### 9.1.13. Beeper

Beeper Volume	0014 <sub>hex</sub> (DPL 3519/20)	H
OFF	0000 0000 RESET	00 <sub>hex</sub>
Maximum Volume (full digital scale FDS)	0111 1111	7F <sub>hex</sub>

Beeper Frequency	0014 <sub>hex</sub> (DPL 3519/20)	L
16 Hz (lowest)	0000 0001	01 <sub>hex</sub>
1 kHz	0100 0000	40 <sub>hex</sub>
4 kHz (highest)	1111 1111	FF <sub>hex</sub>

A squarewave beeper can be added to the loudspeaker channel and the headphone channel. The addition point is just before loudness and volume adjustment.

### 9.1.14. Mode Tone Control

Mode Tone Control	00020 <sub>hex</sub> (DPL 3519/20)	H
Bass and Treble	0000 0000 RESET	00 <sub>hex</sub>
Equalizer	1111 1111	FF <sub>hex</sub>

By means of 'Mode Tone Control', Bass/Treble or Equalizer may be activated.

The Equalizer must also not be used simultaneously with AD input (Source mode = SCART).

## 9.1.15. Equalizer Channel 1

<b>Band 1 1</b> (below 120 Hz)	<b>00021<sub>hex</sub></b> (DPL 3519)	<b>H</b>
<b>Band 2</b> (center: 500 Hz)	<b>00022<sub>hex</sub></b> (DPL 3519)	<b>H</b>
<b>Band 3</b> (center: 1500 Hz)	<b>00023<sub>hex</sub></b> (DPL 3519)	<b>H</b>
<b>Band 4</b> (center: 5000 Hz)	<b>00024<sub>hex</sub></b> (DPL 3519)	<b>H</b>
<b>Band 5</b> (above 10000 Hz)	<b>00025<sub>hex</sub></b> (DPL 3519)	<b>H</b>
+12 dB	0110 0000	60 <sub>hex</sub>
+11 dB	0101 1000	58 <sub>hex</sub>
+1 dB	0000 1000	08 <sub>hex</sub>
+1/8 dB	0000 0001	01 <sub>hex</sub>
0 dB	0000 0000 RESET	00 <sub>hex</sub>
-1/8 dB	1111 1111	FF <sub>hex</sub>
-1 dB	1111 1000	F8 <sub>hex</sub>
-11dB	1010 1000	A8 <sub>hex</sub>
-12 dB	1010 0000	A0 <sub>hex</sub>

With positive equalizer settings, internal overflow may occur even with overall volume less than 0 dB. This will lead to a clipped output signal. Therefore, it is not recommended to set Equalizer bands to a value that, in conjunction with volume, would result in an overall positive gain.

The Equalizer must not be used simultaneously with Bass and Treble (Mode Tone Control must be set to FF to use the Equalizer). If Bass and Treble are used, Equalizer coefficients must be set to zero.

The Equalizer must also not be used simultaneously with AD input (Source mode = SCART).

## 9.1.16. Surround Decoder Modes

<b>Surround Decoder Modes</b>	<b>0040<sub>hex</sub></b> (DPL 3518/19/20)	<b>H</b>
ADAPTIVE (Dolby Pro Logic)	0000 0000 RESET	00 <sub>hex</sub>
PASSIVE	0001 0000	10 <sub>hex</sub>
EFFECT	0010 0000	20 <sub>hex</sub>

The surround decoder mode specifies which method is being used to create four output channels out of two input channels. For Dolby Pro Logic operation the matrix must be switched to ADAPTIVE. Even sound material not encoded in Dolby Surround will produce good surround effects in this mode. All surround reproduction modes can be used together with the ADAPTIVE mode. The PASSIVE mode should only be used together with WIDE mode. The EFFECT mode is intended to get surround effects even in case of mono transmissions (Note: For mono signals, Dolby Pro Logic will only reproduce signals via the center channel. All other channels will be muted). For a more detailed description see section 10.2. "Useful combinations of the surround decoder and reproduction modes".

**9.1.17. Surround Reproduction Modes**

Surround Reproduction Modes	0040 <sub>hex</sub> (DPL 3518/19/20)	L
NORMAL	0000 0000 RESET	00 <sub>hex</sub>
PHANTOM	0001 0000	10 <sub>hex</sub>
WIDE	0010 0000	20 <sub>hex</sub>
THREE_CHANNEL	0011 0000	30 <sub>hex</sub>
CENTER_OFF	0100 0000	40 <sub>hex</sub>
PANORAMA	0101 0000	50 <sub>hex</sub>

The standard mode to reproduce Dolby Pro Logic Surround is NORMAL. All four channels L, C, R, S are in operation. Low Frequency signals of the C channel are distributed to the L and R loudspeakers. This enables the center speaker to be a smaller model than the L and R speaker. If all three front speakers are identical and capable of reproducing low bass information, and if equal power is available in the L, C and R amplifiers, then it may be beneficial to use the WIDE mode. The center channel will then contain the full frequency range signal. The NORMAL and WIDE modes using 4 or 5 loudspeakers give the optimum solution for surround reproduction. Other modes using less loudspeakers create inferior surround effects.

If no center speaker is available, the PHANTOM mode prevents loss of the center information by splitting it up equally to the L and R speakers.

If no surround speaker is available the THREE\_CHANNEL mode can be used. This mode will confine the sound to the front speakers.

The CENTER\_OFF mode provides a simple way to optimize the manual input balance. While switched off, the balance control can be adjusted for minimum dialogue level.

Surround sound can be reproduced to a certain extent even with two loudspeakers. The PANORAMA mode mixes all four surround decoder outputs to the L and R output channel without any loss of information.

**9.1.18. Surround Source Modes**

Surround Source Modes	0041 <sub>hex</sub> (DPL 3518/19/20)	H
NOISE <small>(18/19/20)</small>	0000 0001	01 <sub>hex</sub>
SCART <small>(20)</small>	0000 0010	02 <sub>hex</sub>
I2S1 <small>(18/19/20)</small>	0000 0101	05 <sub>hex</sub>
I2S2 <small>(18/19/20)</small>	0000 0110	06 <sub>hex</sub>

Select the source to be fed to the surround decoder block. The NOISE mode selects a built-in noise generator. If the equalizer is switched on, SCART as source is no longer valid, i.e. AD input is no longer possible.

**9.1.19. Surround Source Matrix Modes**

Surround Source Matrix (Sound Source)	0041 <sub>hex</sub> (DPL 3518/19/20)	L
SOUNDA	0000 0000 RESET	00 <sub>hex</sub>
SOUNDB	0001 0000	10 <sub>hex</sub>
STEREO	0010 0000	20 <sub>hex</sub>
MONO	0011 0000	30 <sub>hex</sub>
Surround Source Matrix (Noise Source)	0041 <sub>hex</sub> (DPL 3518/19/20)	L
NOISE_L	1010 0000	a0 <sub>hex</sub>
NOISE_C	1011 0000	b0 <sub>hex</sub>
NOISE_R	1100 0000	c0 <sub>hex</sub>
NOISE_S	1101 0000	d0 <sub>hex</sub>

Select the mode of the sound source. Real Dolby Pro Logic Surround sound can only be displayed in the STEREO mode. Mono modes such as SOUNDA, SOUNDB and MONO will not produce a surround effect unless the surround decoder mode is switched to EFFECT.

If the equalizer is switched on, the SCART source mode is no longer valid.

The modes NOISE\_L, NOISE\_C, NOISE\_R and NOISE\_S create an input signal to the decoder that will result in a noise signal on the L, C, R and S outputs.

**9.1.20. Surround Delay**

Surround Delay	0042 <sub>hex</sub> (DPL 3518/19/20)	H
5 ms (lowest)	0000 0101	05 <sub>hex</sub>
6 ms	0000 0110	06 <sub>hex</sub>
31 ms (highest)	0001 1111	1F <sub>hex</sub>

For Dolby Pro Logic designs, only 20 ms fixed or 15–30 ms variable delay must be used.

**9.1.21. Surround Manual Input Balance**

Surround Manual Input Balance	0043 <sub>hex</sub> (DPL 3518/19/20)	H
Left muted, Right 100%	0111 1111	7F <sub>hex</sub>
Left 0.8%, Right 100%	0111 1110	7E <sub>hex</sub>
Left 99.2%, Right 100%	0000 0001	01 <sub>hex</sub>
Left 100%, Right 100%	0000 0000 RESET	00 <sub>hex</sub>
Left 100%, Right 99.2%	1111 1111	FF <sub>hex</sub>
Left 100%, Right 0.8%	1000 0010	82 <sub>hex</sub>
Left 100%, Right muted	1000 0001	81 <sub>hex</sub>

In automatic balance mode this register has no effect.

**9.1.22. Surround Input Balance Mode**

Surround Input Balance Mode	0043 <sub>hex</sub> (DPL 3518/19/20)	L
Automatic balance	0000 0000	00 <sub>hex</sub>
Manual balance	0100 0000	40 <sub>hex</sub>

Automatic balance mode is recommended.

**9.1.23. Surround Spatial Effect**

Surround Spatial Effect	0044 <sub>hex</sub> (DPL 3518/19/20)	H
OFF	0000 0000 RESET	00 <sub>hex</sub>
0.8%	0000 0001	01 <sub>hex</sub>
99.2%	0111 1110	7E <sub>hex</sub>
100%	1111 1111	7F <sub>hex</sub>

Increases the perceived basewidth of the reproduced left and right front channels. Recommended value: 50% = 40<sub>hex</sub>. In contrast to the spatial effect for channel 1, the surround spatial effect is optimized for Dolby Pro Logic. The difference is most obvious for the Phantom and Panorama reproduction modes.

**9.1.24. Panorama Sound Effect**

Panorama Sound Effect	0045 <sub>hex</sub> (DPL 3518/19/20)	H
OFF	0000 0000 RESET	00 <sub>hex</sub>
0.8%	0000 0001	01 <sub>hex</sub>
99.2%	0111 1110	7E <sub>hex</sub>
100%	0111 1111	7F <sub>hex</sub>

Strength of the surround effect in PANORAMA mode. Recommended value: 66% = 54<sub>hex</sub>. Delay should be set to the max. value: 31 ms and reverberation should be off. This register only has the correct effect in PANORAMA mode (Surround Reproduction Mode is set to PANORAMA). It must be zero (OFF) in non PANORAMA modes)

**9.1.25. Surround Reverberation**

Surround Reverberation	0046 <sub>hex</sub> (DPL 3518/19/20)	H
OFF	0000 0000 RESET	00 <sub>hex</sub>
0.8%	0000 0001	01 <sub>hex</sub>
99.2%	0111 1110	7E <sub>hex</sub>
100%	0111 1111	7F <sub>hex</sub>

Reverberation will be added to the surround channel. Due to the maximally implemented 31 ms only dry sounds will be affected. The effect will be rather weak for source material which already contains a certain amount of reverberation. It can be used to create a more reverberant sound when using the EFFECT decoder mode for mono signals. Recommended value: not more than 66% = 54<sub>hex</sub>. Delay should be set to the maximum value: 31 ms.

## 9.2. Summary of Readable Registers

All readable registers are 16-bit wide. Transmissions via I<sup>2</sup>C-bus have to take place in 16-bit words.

These registers are not writable.

Name	Address	High/Low	Output Range
Digital input level register	0018 <sub>hex</sub>	H	single bits
Quasi peak readout left	0019 <sub>hex</sub>	H&L	[00 <sub>hex</sub> ... 7FFF <sub>hex</sub> ] 16-bit two's complement
Quasi peak readout right	001a <sub>hex</sub>	H&L	[00 <sub>hex</sub> ... 7FFF <sub>hex</sub> ] 16-bit two's complement

### 9.2.1. Quasi Peak Detector

Quasi peak readout left	0019 <sub>hex</sub> H+L (DPL 3518/19/20)
Quasi peak readout right	001a <sub>hex</sub> H+L (DPL 3518/19/20)
Quasi peak readout	[0 <sub>hex</sub> ... 7FFF <sub>hex</sub> ] values are 16-bit two's complement

The quasi peak readout register can be used to read out the quasi peak level of any input source, in order to adjust all inputs to the same normal listening level. The refresh rate is 32 kHz. The feature is based on a filter time constant:

attack-time: 1.3 ms  
decay-time: 37 ms

### 9.2.2. Digital Input Level Register

Used to read back the input level of certain digital input pins:

Pin	Bit
D_CTR_IN	X--- ----
D_CTR_IO1	-X-- ----
D_CTR_IO0	--X- ----

A high level on the input pins gives a "1", a low level gives "0".

10. Further Explanations and Application Hints

10.1. Overview of the Surround Decoder and Reproductions Modes

The register 0040hex H "surround decoder modes" define which method should be used to create a multichannel signal out of an stereo input.

The register 0040hex L "sound reproduction modes" define which method should be used to mix the multichannel output to the actually used loudspeakers (or final output channels).

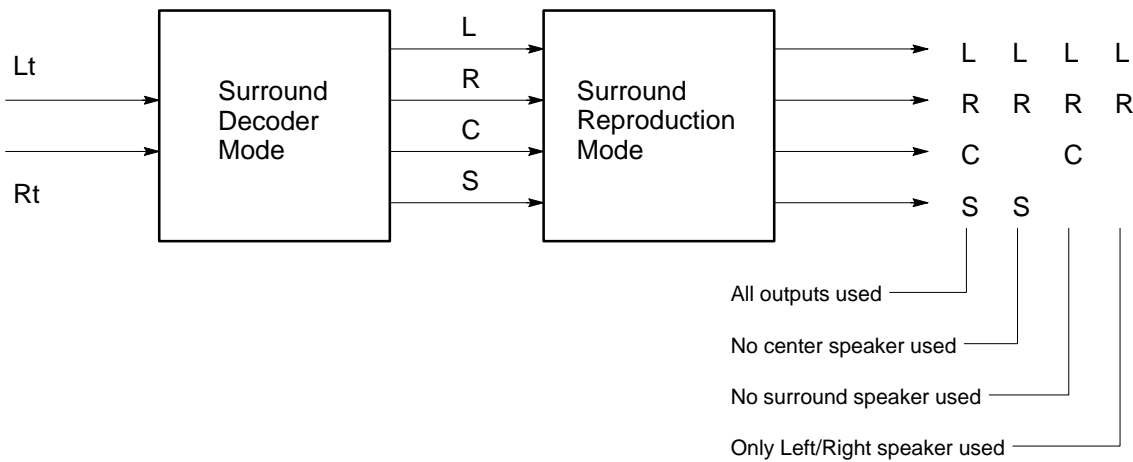

Fig. 10-1: Surround Decoder and Reproduction Mode Principle

The PANORAMA sound reproduction mode mixes all 4 channels into 2 output channels. Fig 10-2 gives the internal processing of this mode. All other reproduction modes are according to the Dolby specification.

Fig. 10-2: Surround Spatial Effect and PANORAMA Sound Processing

**10.2. Useful Combinations of the Surround Decoder and Reproduction Modes**

In principle, the "surround decoder modes" and the "sound reproduction modes" modes could be orthogonal (all "surround decoder modes" can be used with all "sound reproduction modes") but there are some combinations that do not create "good" sound.

**10.2.1. Useful Combinations with the ADAPTIVE Surround Decoder Mode**

NORMAL	all output channels used, L and R speakers have better bass capability
WIDE	all output channels used, L,R and C speakers all have good bass capability
PHANTOM	no center speaker used (note: the center output channel C is muted automatically)
THREE_CHANNEL	no surround speaker used (creates a STEREO like effect, but with better center stage reproduction) (Note: the surround output channel is not automatically muted)
CENTER_OFF	systems with center speaker, only for adjustment of manual input balance. (Note: Dolby suggests to use the adaptive input balance always)
PANORAMA	only L and R speaker used (creates a surround like effect with only 2 speakers) (Note: the left and right output channels L&R are not muted automatically)

**10.2.2. Useful Combinations with the PASSIVE Surround Decoder Mode**

The passive surround decoder (which is defined by Dolby) uses no center speaker! In no cases, a center speaker should be connected to the output (or if, the center speaker should be muted). Only two modes are useful (all other modes give inferior results!):

WIDE	L, R and S speakers used. Do not connect speakers to the center channel
PANORAMA	only L and R speaker used (creates a surround like effect with only 2 speakers, result is inferior to the combination with the ADAPTIVE mode)

**10.2.3. Useful Combinations with the EFFECT Surround Decoder Mode**

The EFFECT surround decoder mode is intended for MONO sources. MONO sources give no surround effect in the ADAPTIVE and PASSIVE modes. In order to give the customer means to create surround sound even in presence of mono signals, the EFFECT mode can be used.

NORMAL	all output channels used, L and R speakers have better bass capability. The center channel may need a lower volume to compensate for the dominant center.
WIDE	all output channels used, L,R and C speakers all have better bass capability. The center channel may need a lower volume to compensate for the dominant center.  or:  no center speaker used (no center speaker connected)
PANORAMA	only L and R speaker used (creates a surround like effect with only 2 speakers, result is inferior to the combination with the ADAPTIVE mode)

### 10.3. Further Notes

1. The ADAPTIVE mode seems to get better results compared to the PASSIVE in all cases, even for source signals that are not encoded in Dolby Surround.
2. Using the EFFECT mode for mono signals creates a very dry surround signal. This can be somewhat compensated with the Surround Reverberation Register (0046hex H).
3. For small speaker spacing the perceived basewidth can be increased by using Surround Spatial Effect (Register 0044hex H). This also works best for the ADAPTIVE mode.
4. Surround Spatial Effect can be used in combination with PANORAMA. This also works best for the ADAPTIVE mode.
5. The adaptive input balance is recommended for the ADAPTIVE mode. In PASSIVE or EFFECT mode, the input balance can be switched to manual in middle position.
6. In PANORAMA mode, the strength of the surround signal can be controlled by the Panorama Sound Effect Register (0045hex H). In other modes, this register has no effect and should be set to 0.

### 10.4. Input and Output Levels for Dolby Pro Logic Operation

The analog inputs are able to accept 2 Vrms input level without overloading any stage before the volume control. The nominal input level (input sensitivity) is 350 mV. This gives 15 dB headroom. The scart prescale value should be set to 0 dB ( $25_{\text{dec}}$ ).

I<sup>2</sup>S-inputs should have the same headroom when entering the DPL. The nominal input level is -15 dBFS. The highest possible input level of 0 dBFS is accepted without internal overflow. The I<sup>2</sup>S-prescale value should be set to 0 dB ( $25_{\text{dec}}$ ).

With higher prescale values lower input sensitivities can be accommodated. A higher input sensitivity is not possible, because at least 15 dB headroom is required for every input according to the Dolby specifications.

A full-scale left only input (2 Vrms) will produce a full-scale left only output with 0 dB volume. The typical output levels are 1.37 Vrms for channel 1 and 2 and 1.9 Vrms for SCART outputs. The I<sup>2</sup>S-channels yield 0 dBFS. The same holds true for right only signals. A full-scale input level on both inputs (Lin=Rin=2 Vrms) will give a center only output with maximum level. The typical output levels are 1.37 Vrms for channel 1 and 2 outputs and 1.9 Vrms for SCART outputs. The I<sup>2</sup>S-channels yield 0 dBFS. A full-scale input level on both inputs (but Lin and Rin with inverted phases) will give a surround-only signal with maximum level.

For reproducing Dolby Pro Logic according to its specifications, the center and surround outputs must be amplified by 3 dB with respect to the L and R output signals. This can be done in two ways:

1. By implementing 3 dB more amplification for center and surround loudspeaker outputs.
2. By always selecting volume for L and R 3 dB lower than center and surround. Method 1 is preferable, as method 2 lowers the achievable SNR for left and right signals by 3 dB.

### 10.5. Dolby Qualification

Qualification testing for Dolby approval requires the device to be switched to plain Dolby Pro Logic without any sound effects. Effects, such as PANORAMA, Surround Spatial Effect or Surround Reverberations must be switched off.

The surround decoder must be switched to ADAPTIVE.

For Dolby Pro Logic designs only 20 ms fixed or 15–30 ms variable delay must be used.

**10.6. Phase Relationship of Outputs**

The analog output signals channel 1, channel 2 and SCART2 of the DPL all have the same phases. The user does not need to correct output phases when using these analog outputs directly. The SCART1 output has opposite phase.

Using the I<sup>2</sup>S-outputs for other DSPs or D/A converters, care has to be taken to adjust for the correct phase. If the attached coprocessor is one of the MSP family, the following schematics help to determine the phase relationship:

**Fig. 10-3:** Phase Diagram of DPL, MSPB, MSPC (>c6) and MSPD

**Fig. 10-4:** Phase Diagram of MSPC (≤c6)

### 10.7. Minimum Control Transmissions for the DPL 3520A

The following listing contains the minimum data transfer for setting up the DPL in stand alone mode. The file resets registers even though these registers are already reset by the hardware reset. This is to ensure, that even without external reset, the original state is restored. Note: the trap is the transmission to register 56dez=38hex. This register must not be 0 (which it is after reset). This is mentioned in the data sheet on page 39 (9.1.8. channel source modes). The format of the listing is the same as the log format of our demo software (without the comments). You can create a file with these transmission codes and execute it via our demo software. Use the I2C -> Init from File - menu.

```

#### 14. IC Failure Report

Three errors have been detected on the A1 versions of following ICs: DPL 3518A, DPL 3519A, and DPL 3520A.

1. The register for the I<sup>2</sup>S2 channel source does not work. Instead of using register 38<sub>hex</sub>, register 0c<sub>hex</sub> (Quasi peak detector source) is used. So, the I<sup>2</sup>S2 source is always the same as the source for the Quasi peak detector. Nevertheless 38<sub>hex</sub> must be programmed to a value other than the reset state of 00<sub>hex</sub> (See note in chapter 9.1.8.).
2. If the DPL is used with manual input balance, the lower 4 bits in register 43 must be zero. Only the upper 4 bits can be programmed.
3. The fast mute feature (registers 00hex and 06hex) does not work. Use normal mute instead.

These errors will be corrected with version A2.

#### 15. Data Sheet History

1. Preliminary Data Sheet: "DPL 3520A, DPL 3519A, DPL 3518A Dolby Pro Logic Processor Family", July 31, 1997, 6251-423-1PD. First release of the preliminary data sheet.
