

To all our customers

---

## **Regarding the change of names mentioned in the document, such as Hitachi Electric and Hitachi XX, to Renesas Technology Corp.**

---

The semiconductor operations of Mitsubishi Electric and Hitachi were transferred to Renesas Technology Corporation on April 1st 2003. These operations include microcomputer, logic, analog and discrete devices, and memory chips other than DRAMs (flash memory, SRAMs etc.) Accordingly, although Hitachi, Hitachi, Ltd., Hitachi Semiconductors, and other Hitachi brand names are mentioned in the document, these names have in fact all been changed to Renesas Technology Corp. Thank you for your understanding. Except for our corporate trademark, logo and corporate statement, no changes whatsoever have been made to the contents of the document, and these changes do not constitute any alteration to the contents of the document itself.

## Cautions

Keep safety first in your circuit designs!

1. Renesas Technology Corporation puts the maximum effort into making semiconductor products better and more reliable, but there is always the possibility that trouble may occur with them. Trouble with semiconductors may lead to personal injury, fire or property damage.

Remember to give due consideration to safety when making your circuit designs, with appropriate measures such as (i) placement of substitutive, auxiliary circuits, (ii) use of nonflammable material or (iii) prevention against any malfunction or mishap.

Notes regarding these materials

1. These materials are intended as a reference to assist our customers in the selection of the Renesas Technology Corporation product best suited to the customer's application; they do not convey any license under any intellectual property rights, or any other rights, belonging to Renesas Technology Corporation or a third party.
2. Renesas Technology Corporation assumes no responsibility for any damage, or infringement of any third-party's rights, originating in the use of any product data, diagrams, charts, programs, algorithms, or circuit application examples contained in these materials.
3. All information contained in these materials, including product data, diagrams, charts, programs and algorithms represents information on products at the time of publication of these materials, and are subject to change by Renesas Technology Corporation without notice due to product improvements or other reasons. It is therefore recommended that customers contact Renesas Technology Corporation or an authorized Renesas Technology Corporation product distributor for the latest product information before purchasing a product listed herein.  
The information described here may contain technical inaccuracies or typographical errors.  
Renesas Technology Corporation assumes no responsibility for any damage, liability, or other loss rising from these inaccuracies or errors.  
Please also pay attention to information published by Renesas Technology Corporation by various means, including the Renesas Technology Corporation Semiconductor home page (<http://www.renesas.com>).
4. When using any or all of the information contained in these materials, including product data, diagrams, charts, programs, and algorithms, please be sure to evaluate all information as a total system before making a final decision on the applicability of the information and products. Renesas Technology Corporation assumes no responsibility for any damage, liability or other loss resulting from the information contained herein.
5. Renesas Technology Corporation semiconductors are not designed or manufactured for use in a device or system that is used under circumstances in which human life is potentially at stake. Please contact Renesas Technology Corporation or an authorized Renesas Technology Corporation product distributor when considering the use of a product contained herein for any specific purposes, such as apparatus or systems for transportation, vehicular, medical, aerospace, nuclear, or undersea repeater use.
6. The prior written approval of Renesas Technology Corporation is necessary to reprint or reproduce in whole or in part these materials.
7. If these products or technologies are subject to the Japanese export control restrictions, they must be exported under a license from the Japanese government and cannot be imported into a country other than the approved destination.  
Any diversion or reexport contrary to the export control laws and regulations of Japan and/or the country of destination is prohibited.
8. Please contact Renesas Technology Corporation for further details on these materials or the products contained therein.

# HN29V25611A Series

256M AND type Flash Memory  
More than 16,057-sector (271,299,072-bit)

ADE-203-1275B (Z)

Rev. 1.0

Jan. 25, 2002

---

## Description

The Hitachi HN29V25611A Series is a CMOS Flash Memory with AND type multi-level memory cells. It has fully automatic programming and erase capabilities with a single 3.0 V power supply. The functions are controlled by simple external commands. To fit the I/O card applications, the unit of programming and erase is as small as (2048 + 64) bytes. Initial available sectors of HN29V25611A are more than 16,057 (98% of all sector address) and less than 16,384 sectors.

## Features

- On-board single power supply ( $V_{CC}$ ):  $V_{CC} = 2.7\text{ V to }3.6\text{ V}$
- Organization
  - AND Flash Memory: (2048 + 64) bytes  $\times$  (More than 16,057 sectors)
  - Data register: (2048 + 64) bytes
- Multi-level memory cell
  - 2 bit/per memory cell
- Automatic programming
  - Sector program time: 1.0 ms (typ)
  - System bus free
  - Address, data latch function
  - Internal automatic program verify function
  - Status data polling function
- Automatic erase
  - Single sector erase time: 1.0 ms (typ)
  - System bus free
  - Internal automatic erase verify function
  - Status data polling function

---

## HN29V25611A Series

---

- Erase mode
  - Single sector erase ((2048 + 64) byte unit)
- Fast serial read access time:
  - First access time: 50  $\mu$ s (max)
  - Serial access time: 50 ns (max)
- Low power dissipation:
  - $I_{CC1}$  = 2 mA (typ) (Read)
  - $I_{CC2}$  = 20 mA (max) (Read)
  - $I_{SB2}$  = 50  $\mu$ A (max) (Standby)
  - $I_{CC3}/I_{CC4}$  = 40 mA (max) (Erase/Program)
  - $I_{SB3}$  = 20  $\mu$ A (max) (Deep standby)
- The following architecture is required for data reliability.
  - Error correction: more than 3-bit error correction per each sector read
  - Spare sectors: 1.8% (290 sectors) (min) within usable sectors

### Ordering Information

Type No.	Available sector	Package
HN29V25611AT-50	More than 16,057 sectors	12.0 $\times$ 18.40 mm <sup>2</sup> 0.5 mm pitch 48-pin plastic TSOP I (TFP-48DA)

Pin Arrangement

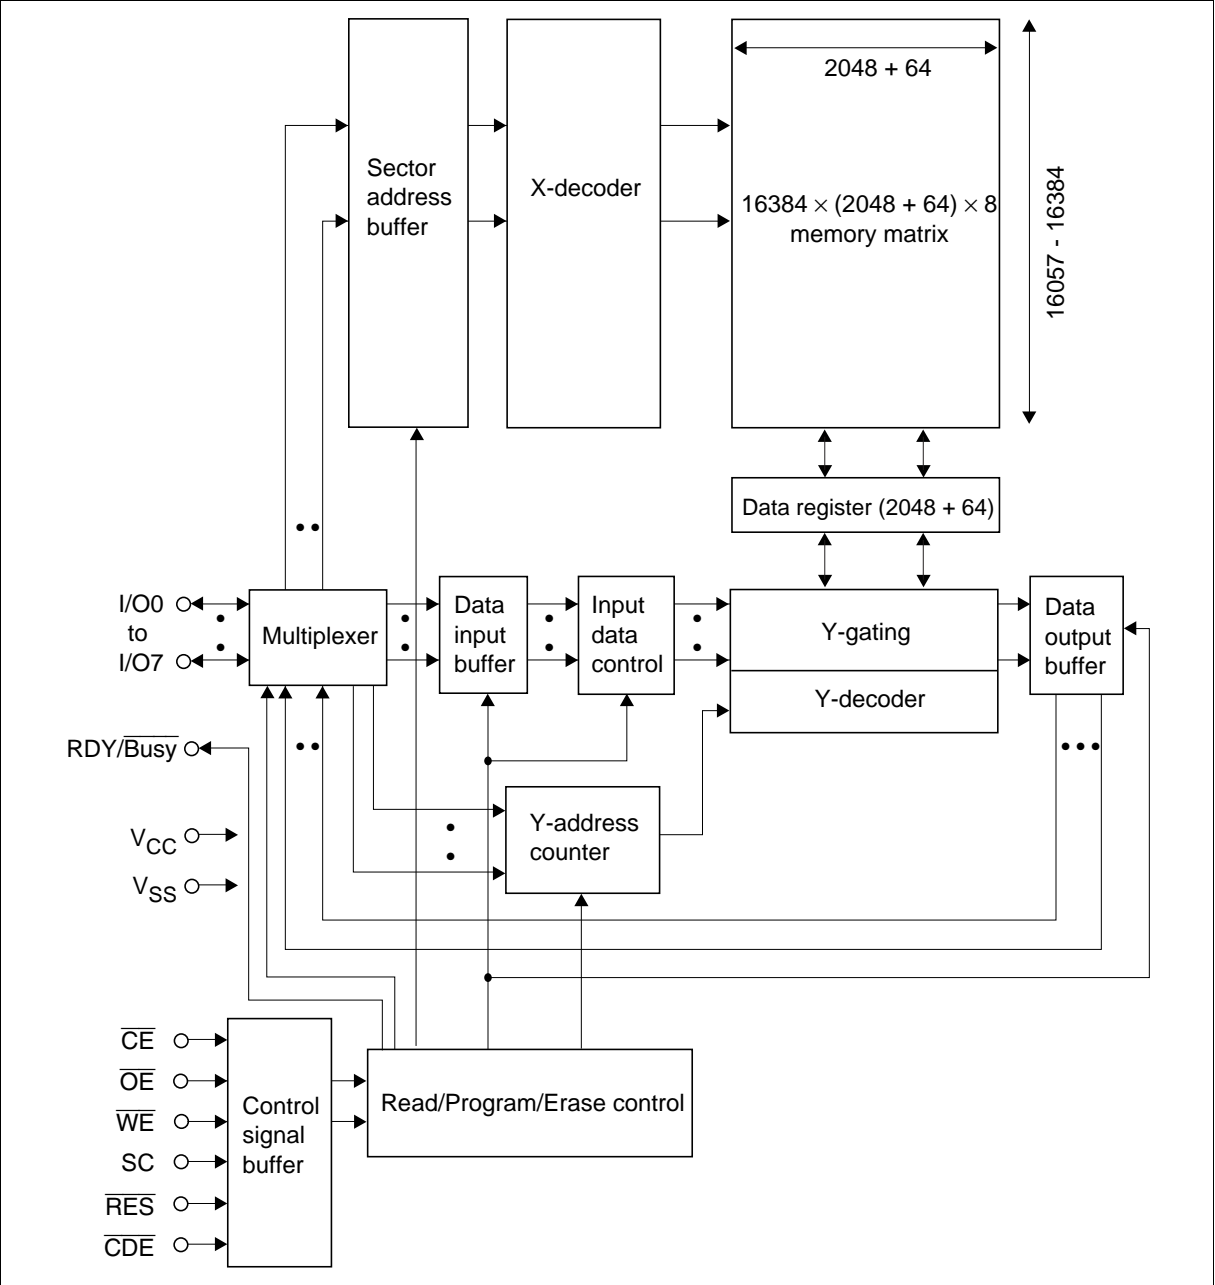

# HN29V25611A Series

## Pin Description

Pin name	Function
I/O0 to I/O7	Input/output
$\overline{\text{CE}}$	Chip enable
$\overline{\text{OE}}$	Output enable
$\overline{\text{WE}}$	Write enable
$\overline{\text{CDE}}$	Command data enable
$\text{V}_{\text{CC}}^{*1}$	Power supply
$\text{V}_{\text{SS}}^{*1}$	Ground
$\text{RDY}/\overline{\text{Busy}}$	Ready/ $\overline{\text{Busy}}$
$\overline{\text{RES}}$	Reset
SC	Serial clock
NC	No connection

Note: 1. All  $\text{V}_{\text{CC}}$  and  $\text{V}_{\text{SS}}$  pins should be connected to a common power supply and a ground, respectively.

Block Diagram

Memory Map and Address

Address	Cycles	I/O0	I/O1	I/O2	I/O3	I/O4	I/O5	I/O6	I/O7
Sector address	SA (1): First cycle	A0	A1	A2	A3	A4	A5	A6	A7
	SA (2): Second cycle	A8	A9	A10	A11	A12	A13	×*2	×
Column address	CA (1): First cycle	A0	A1	A2	A3	A4	A5	A6	A7
	CA (2): Second cycle	A8	A9	A10	A11	×	×	×	×

- Notes: 1. Some failed sectors may exist in the device. The failed sectors can be recognized by reading the sector valid data written in a part of the column address 800 to 83F (The specific address is TBD.). The sector valid data must be read and kept outside of the sector before the sector erase. When the sector is programmed, the sector valid data should be written back to the sector.
2. An × means "Don't care". The pin level can be set to either  $V_{IL}$  or  $V_{IH}$ , referred to DC characteristics.

## Pin Function

**$\overline{\text{CE}}$ :**  $\overline{\text{CE}}$  is used to select the device. The status returns to the standby at the rising edge of  $\overline{\text{CE}}$  in the reading operation. However, the status does not return to the standby at the rising edge of  $\overline{\text{CE}}$  in the busy state in programming and erase operation.

**$\overline{\text{OE}}$ :** Memory data and status register data can be read, when  $\overline{\text{OE}}$  is  $V_{\text{IL}}$ .

**$\overline{\text{WE}}$ :** Commands and address are latched at the rising edge of  $\overline{\text{WE}}$ .

**SC:** Programming and reading data is latched at the rising edge of SC.

**$\overline{\text{RES}}$ :**  $\overline{\text{RES}}$  pin must be kept at the  $V_{\text{ILR}}$  ( $V_{\text{SS}} \pm 0.2 \text{ V}$ ) level when  $V_{\text{CC}}$  is turned on and off. In this way, data in the memory is protected against unintentional erase and programming.  $\overline{\text{RES}}$  must be kept at the  $V_{\text{IHR}}$  ( $V_{\text{CC}} \pm 0.2 \text{ V}$ ) level during any operations such as programming, erase and read.

**$\overline{\text{CDE}}$ :** Commands and data are latched when  $\overline{\text{CDE}}$  is  $V_{\text{IL}}$  and address is latched when  $\overline{\text{CDE}}$  is  $V_{\text{IH}}$ .

**RDY/ $\overline{\text{Busy}}$ :** The RDY/ $\overline{\text{Busy}}$  indicates the program/erase status of the flash memory. The RDY/ $\overline{\text{Busy}}$  signal is initially at a high impedance state. It turns to a  $V_{\text{OL}}$  level after the (40H) command in programming operation or the (B0H) command in erase operation. After the erase or programming operation finishes, the RDY/ $\overline{\text{Busy}}$  signal turns back to the high impedance state.

**I/O0 to I/O7:** The I/O pins are used to input data, address and command, and are used to output memory data and status register data.

## Mode Selection

Mode	$\overline{\text{CE}}$	$\overline{\text{OE}}$	$\overline{\text{WE}}$	SC	$\overline{\text{RES}}$	$\overline{\text{CDE}}$	RDY/ $\overline{\text{Busy}}$ *3	I/O0 to I/O7
Deep standby	$\times$ *4	$\times$	$\times$	$\times$	$V_{\text{ILR}}$	$\times$	$V_{\text{OH}}$	High-Z
Standby	$V_{\text{IH}}$	$\times$	$\times$	$\times$	$V_{\text{IHR}}$	$\times$	$V_{\text{OH}}$	High-Z
Output disable	$V_{\text{IL}}$	$V_{\text{IH}}$	$V_{\text{IH}}$	$\times$	$V_{\text{IHR}}$	$\times$	$V_{\text{OH}}$	High-Z
Status register read*1	$V_{\text{IL}}$	$V_{\text{IL}}$	$V_{\text{IH}}$	$\times$	$V_{\text{IHR}}$	$\times$	$V_{\text{OH}}$	Status register outputs
Command write*2	$V_{\text{IL}}$	$V_{\text{IH}}$	$V_{\text{IL}}$	$V_{\text{IL}}$	$V_{\text{IHR}}$	$V_{\text{IL}}$	$V_{\text{OH}}$	Din

- Notes: 1. Default mode after the power on is the status register read mode (refer to status transition). From I/O0 to I/O7 pins output the status, when  $\overline{\text{CE}} = V_{\text{IL}}$  and  $\overline{\text{OE}} = V_{\text{IL}}$  (conventional read operation condition).
2. Refer to the command definition. Data can be read, programmed and erased after commands are written in this mode.
3. The RDY/ $\overline{\text{Busy}}$  bus should be pulled up to  $V_{\text{CC}}$  to maintain the  $V_{\text{OH}}$  level while the RDY/ $\overline{\text{Busy}}$  pin outputs a high impedance.
4. An  $\times$  means "Don't care". The pin level can be set to either  $V_{\text{IL}}$  or  $V_{\text{IH}}$  referred to DC characteristics.

# HN29V25611A Series

## Command Definition\*1, 2

Command		Bus cycles	First bus cycle		Second bus cycle		
			Operation mode*3	Data in	Operation mode	Data in	Data out
Read	Serial read (1)	(Without CA)	3	Write	00H	Write	SA (1)*4
		(With CA)	3 + 2h*6	Write	00H	Write	SA (1)*4
	Serial read (2)		3	Write	F0H	Write	SA (1)*4
	Read identifier codes		1	Write	90H	Read	ID*8, 9

	Program (4)	(Without CA)* <sup>7</sup>	4			
		(With CA)* <sup>7</sup>	4 + 2h* <sup>6</sup>	Write	CA (2)	Write 40H** <sup>11, 12</sup>
Reset		1				
Clear status register		1				
Data recovery write		4				

- Notes: 1. Commands and sector address are latched at rising edge of  $\overline{WE}$  pulses. Program data is latched at rising edge of SC pulses.
2. The chip is in the read status register mode when  $\overline{RES}$  is set to  $V_{IHR}$  first time after the power up.
3. Refer to the command read and write mode in mode selection.
4. SA (1) = Sector address (A0 to A7), SA (2) = Sector address (A8 to A13).
5. CA (1) = Column address (A0 to A7), CA (2) = Column address (A8 to A11).  
( $0 \leq A11$  to  $A0 \leq 83FH$ )
6. The variable h is the input number of times of set of CA (1) and CA (2) ( $1 \leq h \leq 2048 + 64$ ).  
Set of CA (1) and CA (2) can be input without limitation.
7. By using program (1) and (3), data can additionally be programmed maximum 15 times for each sector before erase.
8. ID = Identifier code; Manufacturer code (07H), Device code (9AH).
9. The manufacturer identifier code is output when  $\overline{CDE}$  is low and the device identifier code is output when  $\overline{CDE}$  is high.
10. Before program (2) operations, data in the programmed sector must be erased.
11. No commands can be written during auto program and erase (when the RDY/ $\overline{Busy}$  pin outputs a  $V_{OL}$ ).
12. The fourth or sixth cycle of the auto program comes after the program data input is complete.

## Mode Description

### Read

**Serial Read (1):** Memory data D0 to D2111 in the sector of address SA is sequentially read. Output data is not valid after the number of the SC pulse exceeds 2112. When CA is input, memory data D (m) to D (m + j) in the sector of address SA is sequentially read. Then output data is not valid after the number of the SC pulse exceeds (2112 to m). The mode turns back to the standby mode at any time when  $\overline{CE}$  is  $V_{IH}$ .

**Serial Read (2):** Memory data D2048 to D2111 in the sector of address SA is sequentially read. Output data is not valid after the number of the SC pulse exceeds 64. The mode turns back to the standby mode at any time when  $\overline{CE}$  is  $V_{IH}$ .

### Automatic Erase

**Single Sector Erase:** Memory data D0 to D2111 in the sector of address SA is erased automatically by internal control circuits. After the sector erase starts, the erasure completion can be checked through the RDY/ $\overline{Busy}$  signal and status data polling. All the bits in the sector are "1" after the erase. The sector valid data stored in a part of memory data D2048 to D2111 must be read and kept outside of the sector before the sector erase.

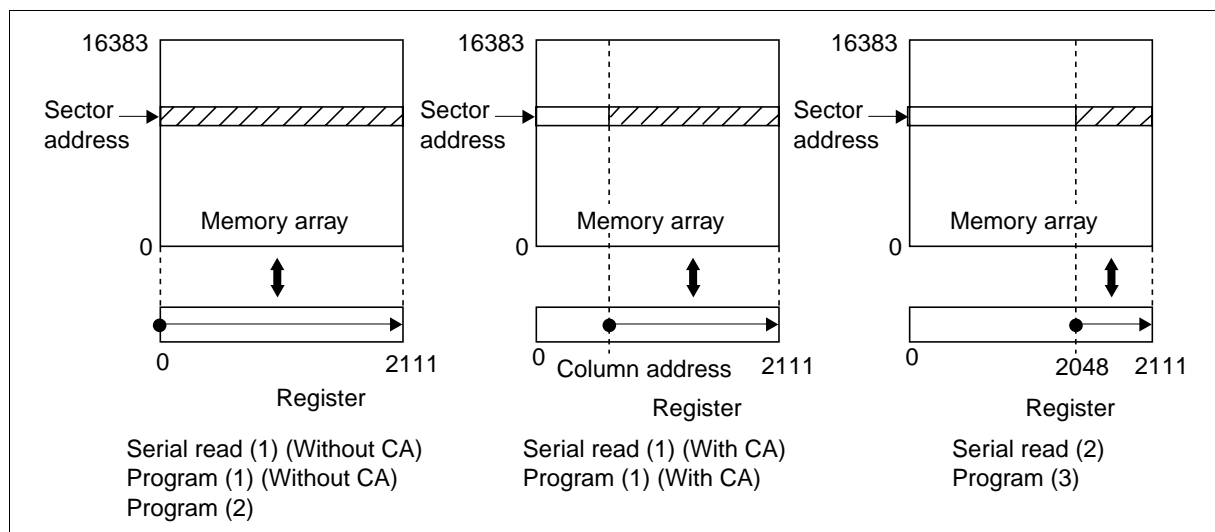

### Automatic Program

**Program (1):** Program data PD0 to PD2111 is programmed into the sector of address SA automatically by internal control circuits. When CA is input, program data PD (m) to PD (m + j) is programmed from CA into the sector of address SA automatically by internal control circuits. By using program (1), data can additionally be programmed 15 times for each sector before the following erase. When the column is programmed, the data of the column must be [FF]. After the programming starts, the program completion can be checked through the RDY/ $\overline{Busy}$  signal and status data polling. Programmed bits in the sector turn from "1" to "0" when they are programmed. The sector valid data should be included in the program data PD2048 to PD2111.

**Program (2):** Program data PD0 to PD2111 is programmed into the sector of address SA automatically by internal control circuits. After the programming starts, the program completion can be checked through the RDY/ $\overline{Busy}$  signal and status data polling. Programmed bits in the sector turn from "1" to "0" when they are programmed. The sector must be erased before programming. The sector valid data should be included in the program data PD2048 to PD2111.

**Program (3):** Program data PD2048 to PD2111 is programmed into the sector of address SA automatically by internal control circuits. By using program (3), data can additionally be programmed 15 times for each sector before the following erase. When the column is programmed, the data of the column must be [FF]. After the programming starts, the program completion can be checked through the RDY/ $\overline{Busy}$  signal and status data polling. Programmed bits in the sector turn from "1" to "0" when they are programmed.

**Program (4):** Program data PD0 to PD2111 is programmed into the sector of address SA automatically by internal control circuits. When CA is input, program data PD (m) to PD (m + j) is programmed from CA into the sector of address SA automatically by internal control circuits. By using program (4), data can be rewritten for each sector before the following erase. So the column data before programming operation are either "1" or "0". In this mode, E/W number of times must be counted whenever program (4) execute. After the programming starts, the program completion can be checked through the RDY/Busy signal and status data polling. The sector valid data should be included in the program data PD2048 to PD2111.

## Status Register Read

The status returns to the status register read mode from standby mode, when  $\overline{\text{CE}}$  and  $\overline{\text{OE}}$  is  $\text{V}_{\text{IL}}$ . In the status register read mode, I/O pins output the same operation status as in the status data polling defined in the function description.

## Identifier Read

The manufacturer and device identifier code can be read in the identifier read mode. The manufacturer and device identifier code is selected with  $\overline{\text{CDE}} \text{ V}_{\text{II}}$  and  $\text{V}_{\text{IH}}$ , respectively.

### **Data Recovery Read**

When the programming was an error, the program data can be read by using data recovery read. When an additional programming was an error, the data compounded of the program data and the origin data in the sector address SA can be read. Output data are not valid after the number of SA pulse exceeds 2112. The mode turns back to the standby mode at any time when  $\overline{CE}$  is  $V_{IH}$ . The read data are invalid when addresses are latched at a rising edge of  $\overline{WE}$  pulse after the data recovery read command is written.

### **Data Recovery Write**

When the programming into a sector of address SA was an error, the program data can be rewritten automatically by internal control circuit into the other selected sector of address SA'. Since the data recovery write mode is internally Program (4) mode, rewritten sector of address SA' needs no sector erase before rewrite. After the data recovery write mode starts, the program completion can be checked through the  $\overline{RDY}/\overline{Busy}$  signal and the status data polling.

## Absolute Maximum Ratings

Parameter	Symbol	Value	Unit	Notes
V <sub>CC</sub> voltage	V <sub>CC</sub>	−0.6 to +4.6	V	1
V <sub>SS</sub> voltage	V <sub>SS</sub>	0	V	
All input and output voltages	V <sub>in</sub> , V <sub>out</sub>	−0.6 to +4.6	V	1, 2
Operating temperature range	T <sub>opr</sub>	0 to +70	°C	
Storage temperature range	T <sub>stg</sub>	−65 to +125	°C	3
Storage temperature under bias	T <sub>bias</sub>	−10 to +80	°C	

Notes: 1. Relative to V<sub>SS</sub>.  
2. V<sub>in</sub>, V<sub>out</sub> = −2.0 V for pulse width ≤ 20 ns.  
3. Device storage temperature range before programming.

## Capacitance (T<sub>a</sub> = 25°C, f = 1 MHz)

Parameter	Symbol	Min	Typ	Max	Unit	Test conditions
Input capacitance	C <sub>in</sub>	—	—	6	pF	V <sub>in</sub> = 0 V
Output capacitance	C <sub>out</sub>	—	—	12	pF	V <sub>out</sub> = 0 V

**DC Characteristics** ( $V_{CC} = 2.7 \text{ V to } 3.6 \text{ V}$ ,  $T_a = 0 \text{ to } +70^\circ\text{C}$ )

Parameter	Symbol	Min	Typ	Max	Unit	Test conditions
Input leakage current	$I_{LI}$	—	—	2	$\mu\text{A}$	$V_{in} = V_{SS} \text{ to } V_{CC}$
Output leakage current	$I_{LO}$	—	—	2	$\mu\text{A}$	$V_{out} = V_{SS} \text{ to } V_{CC}$
Standby $V_{CC}$ current	$I_{SB1}$	—	0.3	1	$\text{mA}$	$\overline{CE} = V_{IH}$
	$I_{SB2}$	—	30	50	$\mu\text{A}$	$\overline{CE} = V_{CC} \pm 0.2 \text{ V}$ , $\overline{RES} = V_{CC} \pm 0.2 \text{ V}$
Deep standby $V_{CC}$ current	$I_{SB3}$	—	1	20	$\mu\text{A}$	$\overline{RES} = V_{SS} \pm 0.2 \text{ V}$
Operating $V_{CC}$ current	$I_{CC1}$	—	2	20	$\text{mA}$	$I_{out} = 0 \text{ mA}$ , $f = 0.2 \text{ MHz}$
	$I_{CC2}$	—	10	20	$\text{mA}$	$I_{out} = 0 \text{ mA}$ , $f = 20 \text{ MHz}$
Operating $V_{CC}$ current (Program)	$I_{CC3}$	—	20	40	$\text{mA}$	In programming
Operating $V_{CC}$ current (Erase)	$I_{CC4}$	—	20	40	$\text{mA}$	In erase
Input voltage	$V_{IL}$	$-0.3^{*1, 2}$	—	0.8	$\text{V}$	
	$V_{IH}$	2.0	—	$V_{CC} + 0.3^{*3}$	$\text{V}$	
Input voltage ( $\overline{RES}$ pin)	$V_{ILR}$	-0.2	—	0.2	$\text{V}$	
	$V_{IHR}$	$V_{CC} - 0.2$	—	$V_{CC} + 0.2$	$\text{V}$	
Output voltage	$V_{OL}$	—	—	0.4	$\text{V}$	$I_{OL} = 2 \text{ mA}$
	$V_{OH}$	2.4	—	—	$\text{V}$	$I_{OH} = -2 \text{ mA}$

Notes: 1.  $V_{IL}$  min =  $-1.0 \text{ V}$  for pulse width  $\leq 50 \text{ ns}$  in the read operation.  $V_{IL}$  min =  $-2.0 \text{ V}$  for pulse width  $\leq 20 \text{ ns}$  in the read operation.  
2.  $V_{IL}$  min =  $-0.6 \text{ V}$  for pulse width  $\leq 20 \text{ ns}$  in the erase/data programming operation.  
3.  $V_{IH}$  max =  $V_{CC} + 1.5 \text{ V}$  for pulse width  $\leq 20 \text{ ns}$ . If  $V_{IH}$  is over the specified maximum value, the operations are not guaranteed.

**AC Characteristics** ( $V_{CC} = 2.7 \text{ V to } 3.6 \text{ V}$ ,  $T_a = 0 \text{ to } +70^\circ\text{C}$ )

**Test Conditions**

- Input pulse levels:  $0.4 \text{ V}/2.4 \text{ V}$
- Input pulse levels for  $\overline{RES}$ :  $0.2 \text{ V}/V_{CC} - 0.2 \text{ V}$
- Input rise and fall time:  $\leq 5 \text{ ns}$
- Output load: 1 TTL gate +  $100 \text{ pF}$  (Including scope and jig.)
- Reference levels for measuring timing:  $0.8 \text{ V}$ ,  $1.8 \text{ V}$

# HN29V25611A Series

## Power on and off, Serial Read Mode

Parameter	Symbol	Min	Typ	Max	Unit	Test conditions	Notes
Write cycle time	$t_{CWC}$	120	—	—	ns		
Serial clock cycle time	$t_{SCC}$	50	—	—	ns		
$\overline{CE}$ setup time	$t_{CES}$	0	—	—	ns		
$\overline{CE}$ hold time	$t_{CEH}$	0	—	—	ns		
Write pulse time	$t_{WP}$	60	—	—	ns	$\overline{CE} = V_{IL}, \overline{OE} = V_{IH}$	
Write pulse high time	$t_{WPH}$	40	—	—	ns		
Address setup time	$t_{AS}$	50	—	—	ns		
Address hold time	$t_{AH}$	10	—	—	ns		
Data setup time	$t_{DS}$	50	—	—	ns		
Data hold time	$t_{DH}$	10	—	—	ns		
SC to output delay	$t_{SAC}$	—	—	50	ns	$\overline{CE} = \overline{OE} = V_{IL}, \overline{WE} = V_{IH}$	
$\overline{OE}$ setup time for SC	$t_{OES}$	0	—	—	ns		
$\overline{OE}$ low to output low-Z	$t_{OEL}$	0	—	40	ns		
$\overline{OE}$ setup time before read	$t_{OER}$	100	—	—	ns		
$\overline{OE}$ setup time before command write	$t_{OEWS}$	0	—	—	ns		
SC to output hold	$t_{SH}$	15	—	—	ns	$\overline{CE} = \overline{OE} = V_{IL}, \overline{WE} = V_{IH}$	
$\overline{OE}$ high to output float	$t_{DF}$	—	—	40	ns	$\overline{CE} = V_{IL}, \overline{WE} = V_{IH}$	1
$\overline{WE}$ to SC delay time	$t_{WSD}$	50	—	—	$\mu s$		2
$\overline{RES}$ to $\overline{CE}$ setup time	$t_{RP}$	0.3	—	—	ms		
SC to $\overline{OE}$ hold time	$t_{SOH}$	50	—	—	ns		
SC pulse width	$t_{SP}$	20	—	—	ns		
SC pulse low time	$t_{SPL}$	20	—	—	ns		
SC setup time for $\overline{CE}$	$t_{SCS}$	0	—	—	ns		
$\overline{CDE}$ setup time for $\overline{WE}$	$t_{CDS}$	0	—	—	ns		
$\overline{CDE}$ hold time for $\overline{WE}$	$t_{CDH}$	20	—	—	ns		
$V_{CC}$ setup time for $\overline{RES}$	$t_{VRS}$	1	—	—	$\mu s$	$\overline{CE} = V_{IH}$	
$\overline{RES}$ to $V_{CC}$ hold time	$t_{VRH}$	1	—	—	$\mu s$	$\overline{CE} = V_{IH}$	
$\overline{CE}$ setup time for $\overline{RES}$	$t_{CESR}$	1	—	—	$\mu s$		
RDY/Busy undefined for $V_{CC}$ off	$t_{DFP}$	0	—	—	ns		
$\overline{RES}$ high to device ready	$t_{BSY}$	—	—	0.3	ms		
$\overline{CE}$ pulse high time	$t_{CPH}$	200	—	—	ns		
$\overline{CE}, \overline{WE}$ setup time for $\overline{RES}$	$t_{CWRS}$	0	—	—	ns		
$\overline{RES}$ to $\overline{CE}, \overline{WE}$ hold time	$t_{CWRH}$	0	—	—	ns		

Parameter	Symbol	Min	Typ	Max	Unit	Test conditions	Notes
SC setup for $\overline{WE}$	$t_{SW}$	50	—	—	ns		
$\overline{CE}$ hold time for $\overline{OE}$	$t_{COH}$	0	—	—	ns		
SA (2) to CA (2) delay time	$t_{SCD}$	—	—	30	$\mu s$		
RDY/ $\overline{Busy}$ setup for SC	$t_{RS}$	200	—	—	ns		
Time to device busy	$t_{DB}$	—	—	150	ns		
Busy time on read mode	$t_{RBSY}$	—	45	—	$\mu s$		

Notes: 1.  $t_{DF}$  is a time after which the I/O pins become open.

2.  $t_{WSD}$  (min) is specified as a reference point only for SC, if  $t_{WSD}$  is greater than the specified  $t_{WSD}$  (min) limit, then access time is controlled exclusively by  $t_{SAC}$ .

## Program, Erase and Erase Verify

Parameter	Symbol	Min	Typ	Max	Unit	Test conditions	Note

SC to output hold	$t_{\text{SH}}$	15	—	—	ns		
RDY/Busy setup for SC	$t_{\text{RS}}$	200	—	—	ns		
Busy time on read mode	$t_{\text{RBSY}}$	—	45	—	$\mu\text{s}$		

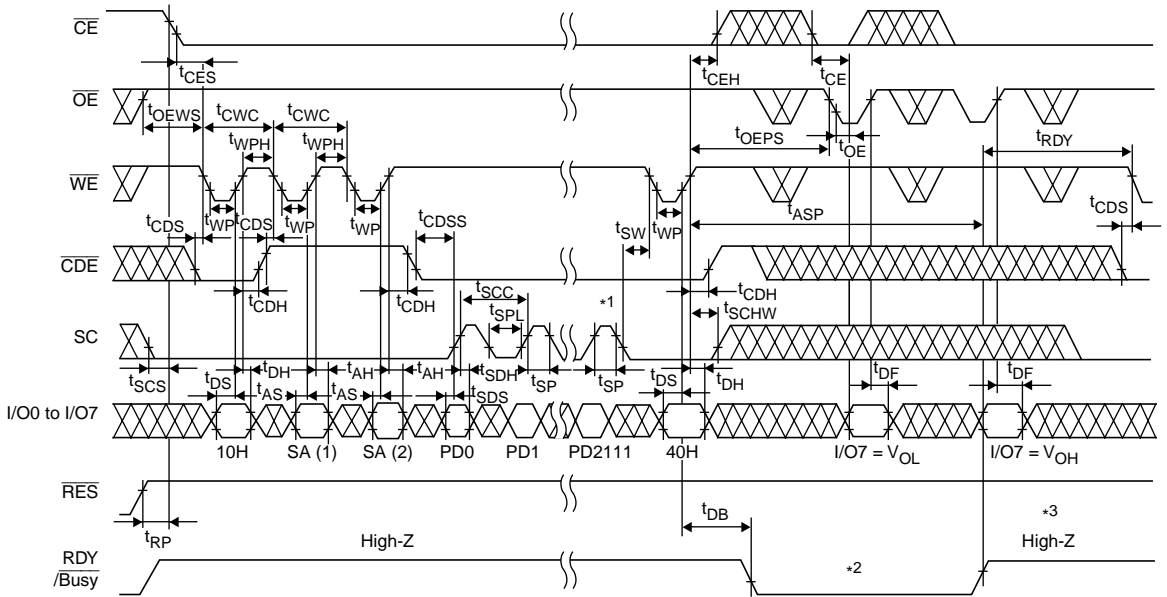

Note: 1.  $t_{\text{DF}}$  is a time after which the I/O pins become open.

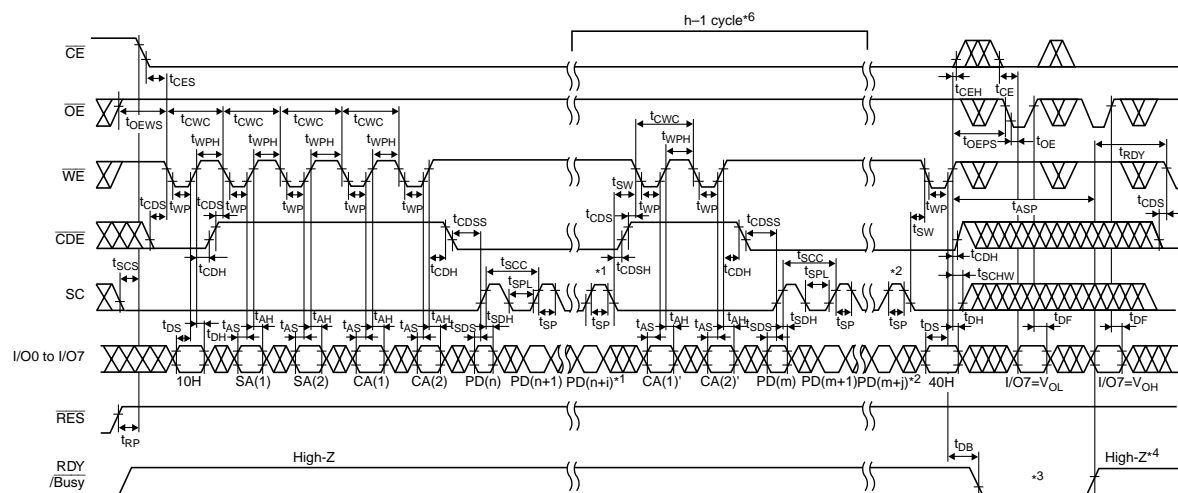

Program (1) and Status Data Polling Timing Waveform

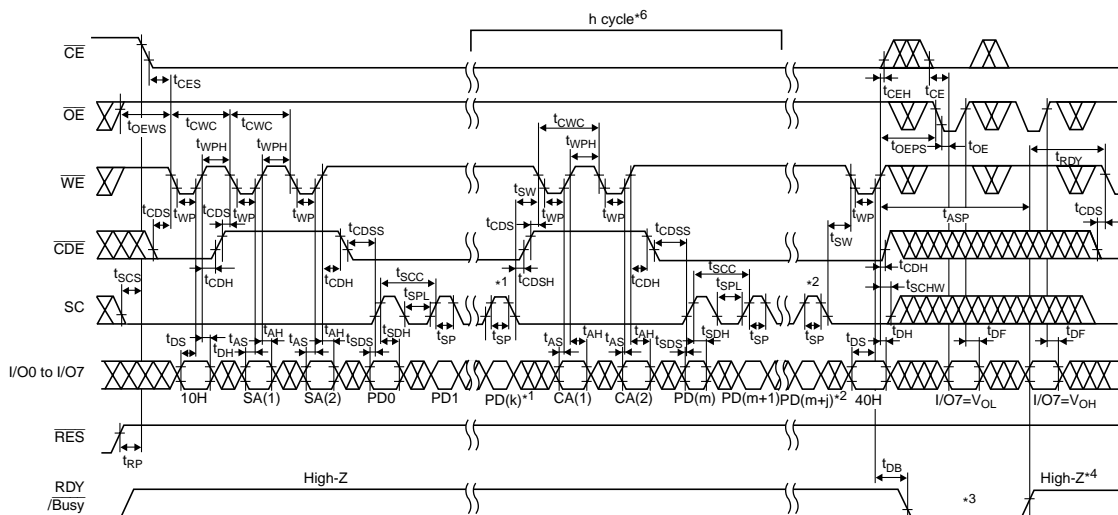

- Notes:
1. The programming operation is not guaranteed when the number of the SC pulse exceeds 2112.
  2. Any commands, including reset command FFH, cannot be input while RDY/Busy is  $V_{OL}$ .
  3. The status returns to the standby status after RDY/Busy returns to High-Z.
  4. By using program (1), data can be programmed additionally for each sector before erase.

## Program (1) with CA before SC and Status Data Polling Timing Waveform

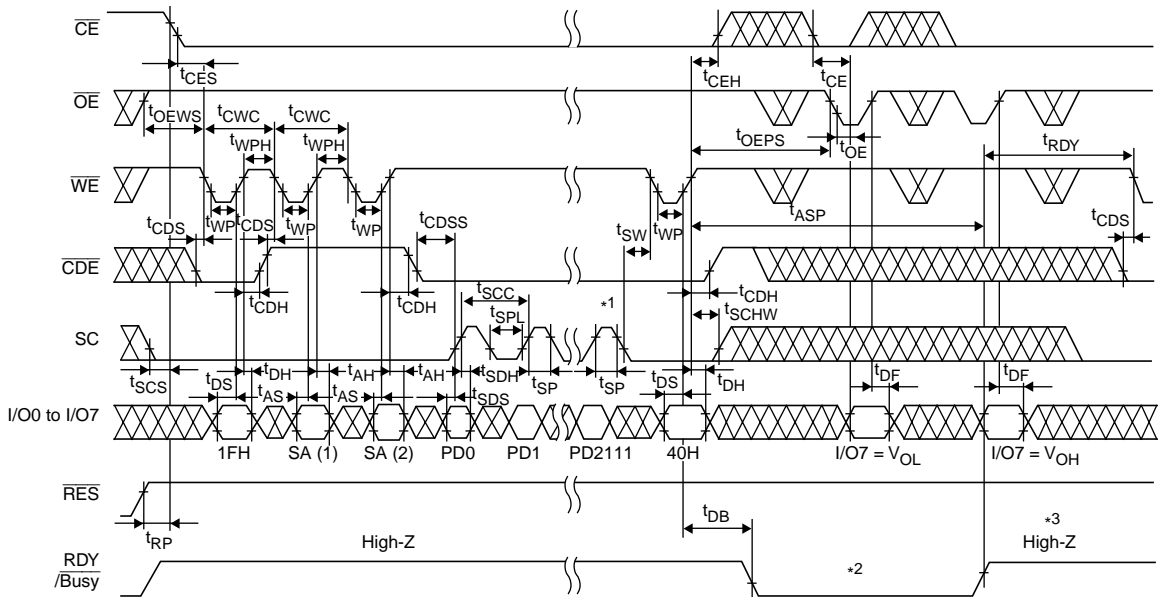

- Notes: 1. The programming operation is not guaranteed when the number of the SC pulse exceeds  $(2112 - n)$ ,  $(i \leq 2111 - n, 0 \leq n \leq 2111)$   
 2. The programming operation is not guaranteed when the number of the SC pulse exceeds  $(2112 - m)$ ,  $(j \leq 2111 - m, 0 \leq m \leq 2111)$   
 3. Any commands, including reset command FFH, cannot be input while RDY/Busy is  $V_{OL}$ .  
 4. The status returns to the standby status after RDY/Busy returns to High-Z.  
 5. By using program (1), data can be programmed additionally for each sector before erase.  
 6. This interval can be repeated  $(h - 1)$  cycle,  $(1 \leq h \leq 2048 + 64)$

## Program (1) with CA after SC and Status Data Polling Timing Waveform

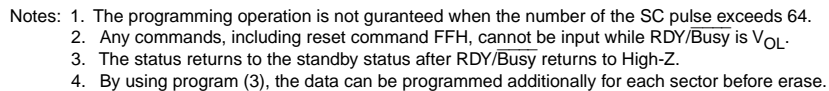

- Notes: 1. The programming operation is not guaranteed when the number of the SC pulse exceeds 2112,  $(0 \leq k \leq 2111)$   
 2. The programming operation is not guaranteed when the number of the SC pulse exceeds  $(2112 - m)$ ,  $(j \leq 2111 - m, 0 \leq m \leq 2111)$   
 3. Any commands, including reset command FFH, cannot be input while RDY/Busy is  $V_{OL}$ .  
 4. The status returns to the standby status after RDY/Busy returns to High-Z.  
 5. By using program (1), data can be programmed additionally for each sector before erase.  
 6. This interval can be repeated  $h$  cycle,  $(1 \leq h \leq 2048 + 64)$

Program (2) and Status Data Polling Timing Waveform

- Notes:
1. The programming operation is not guaranteed when the number of the SC pulse exceeds 2112.
  2. Any commands, including reset command FFH, cannot be input while RDY/Busy is  $V_{OL}$ .
  3. The status returns to the standby status after RDY/Busy returns to High-Z.
  4. By using program (2), the programmed data of each sector must be erased before programming next data.

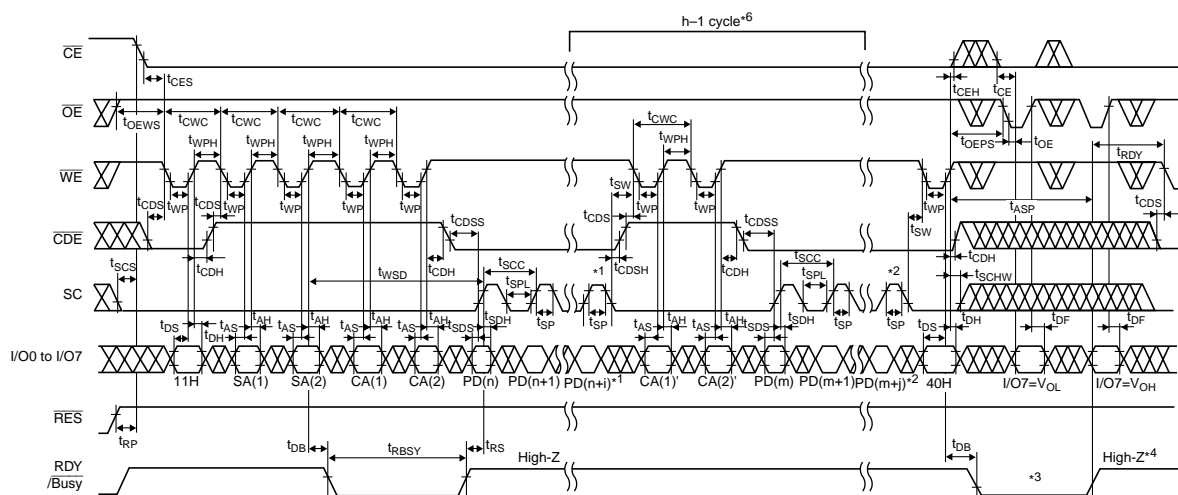

Program (4) and Status Data Polling Timing Waveform

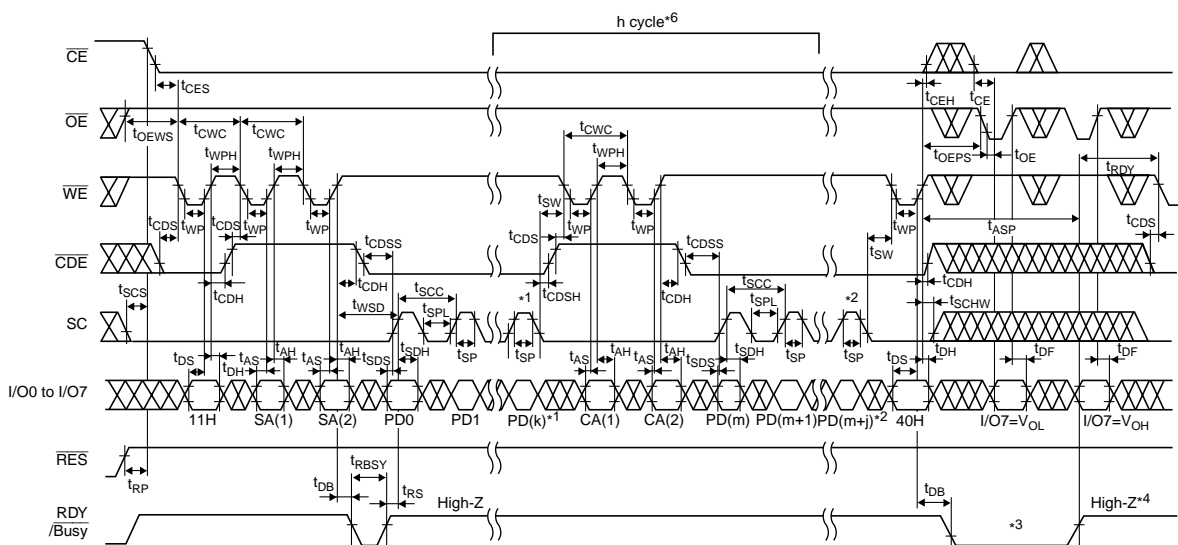

- Notes:
1. The programming operation is not guaranteed when the number of the SC pulse exceeds 2112.
  2. Any commands, including reset command FFH, cannot be input while RDY/Busy is  $V_{OL}$ .
  3. The status returns to the standby status after RDY/Busy returns to High-Z.
  4. By using program (4), data can be rewritten for each sector.

## Program (4) with CA before SC and Status Data Polling Timing Waveform

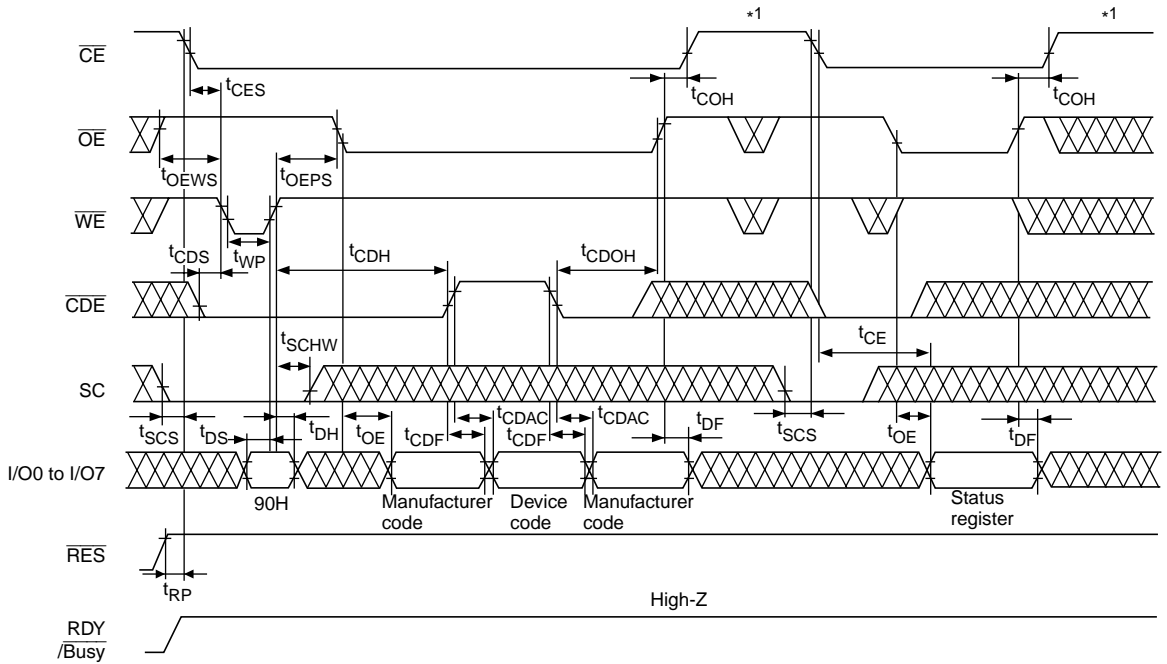

- Notes: 1. The programming operation is not guaranteed when the number of the SC pulse exceeds  $(2112 - n)$ ,  $(i \leq 2111 - n, 0 \leq n \leq 2111)$   
 2. The programming operation is not guaranteed when the number of the SC pulse exceeds  $(2112 - m)$ ,  $(j \leq 2111 - m, 0 \leq m \leq 2111)$   
 3. Any commands, including reset command FFH, cannot be input while RDY/Busy is  $V_{OL}$ .  
 4. The status returns to the standby status after RDY/Busy returns to High-Z.  
 5. By using program (4), data can be rewritten for each sector.  
 6. This interval can be repeated  $(h - 1)$  cycle,  $(1 \leq h \leq 2048 + 64)$

## Program (4) with CA after SC and Status Data Polling Timing Waveform

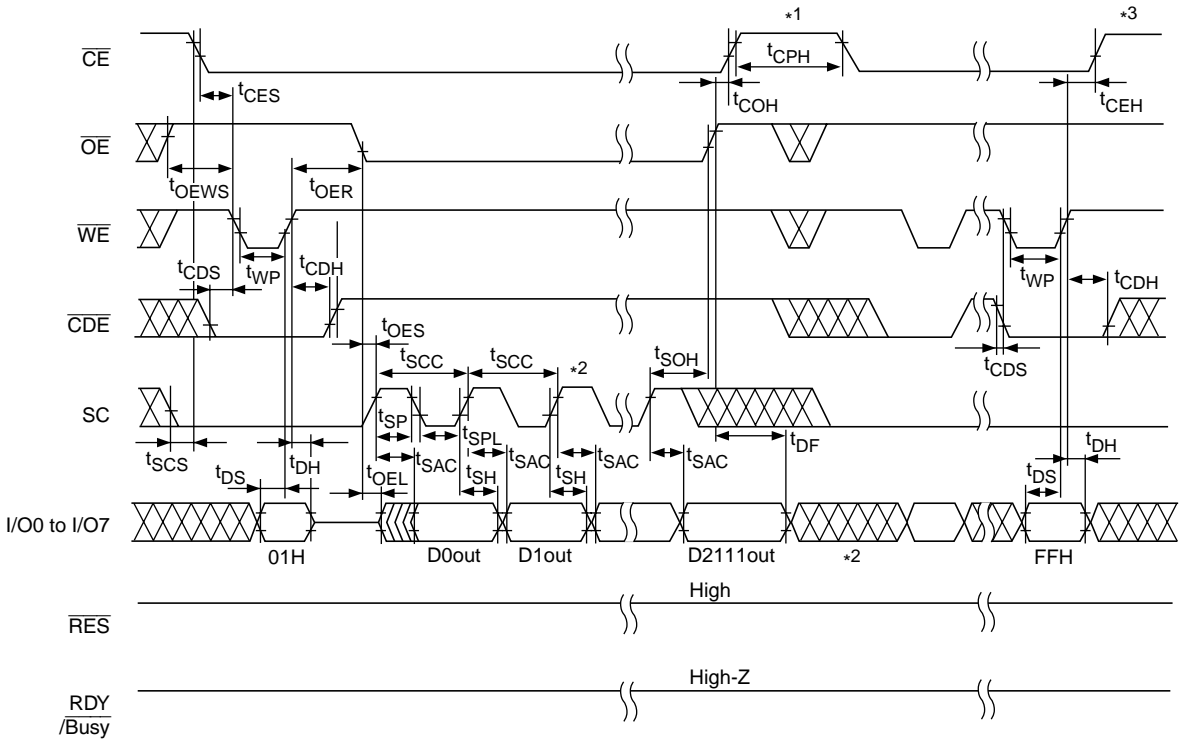

- Notes: 1. The programming operation is not guaranteed when the number of the SC pulse exceeds 2112,  $(0 \leq k \leq 2111)$   
 2. The programming operation is not guaranteed when the number of the SC pulse exceeds  $(2112 - m)$ ,  $(j \leq 2111 - m, 0 \leq m \leq 2111)$   
 3. Any commands, including reset command FFH, cannot be input while RDY/Busy is  $V_{OL}$ .  
 4. The status returns to the standby status after RDY/Busy returns to High-Z.  
 5. By using program (4), data can be rewritten for each sector.  
 6. This interval can be repeated  $h$  cycle,  $(1 \leq h \leq 2048 + 64)$

# ID and Status Register Read Timing Waveform

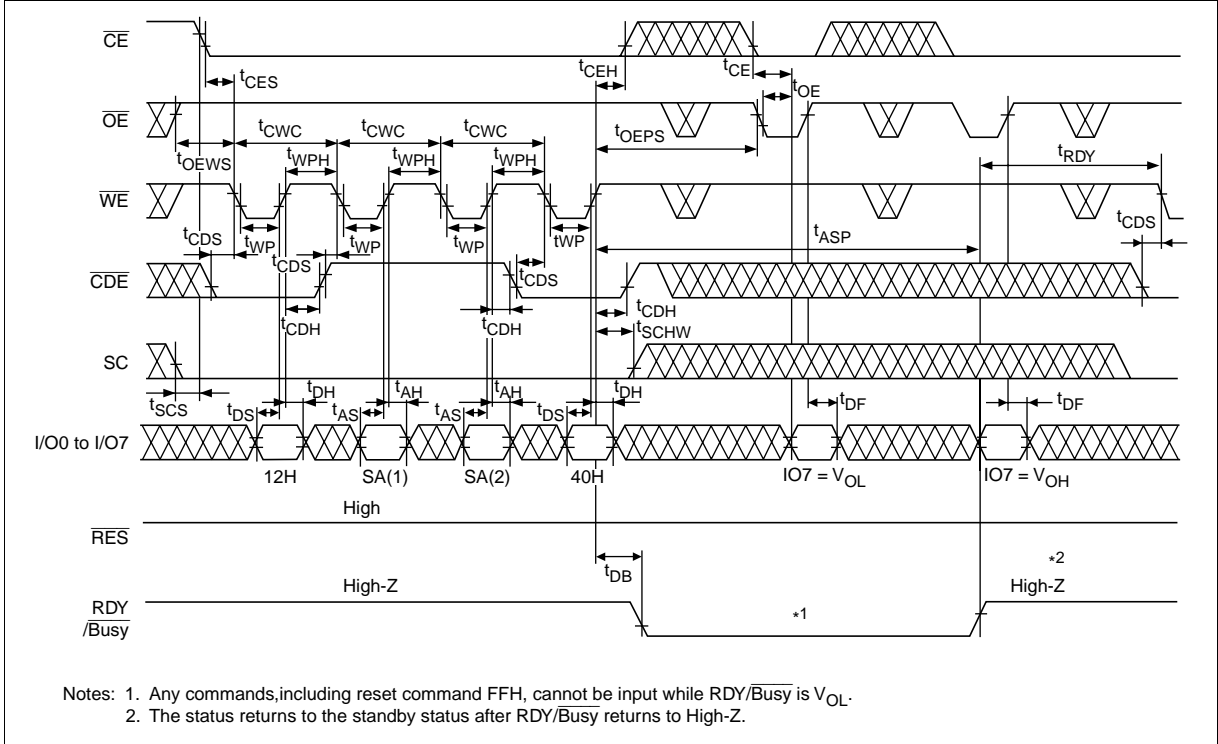

Data Recovery Read Timing Waveform

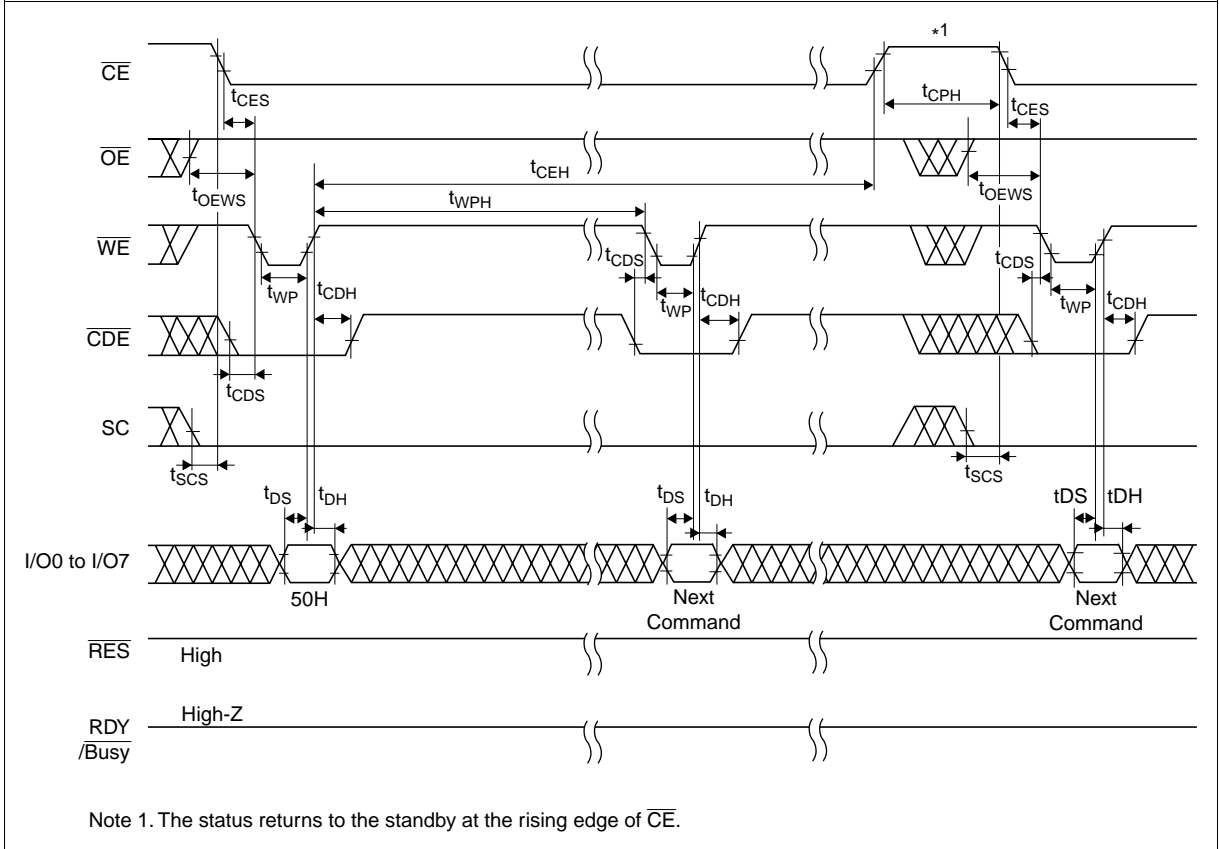

- Notes:
1. The status returns to the standby at the rising edge of  $\overline{CE}$ .
  2. Output data is not valid after the number of the SC pulse exceed 2112 in the recovery data read mode.
  3. After any commands are written, the status can turns to the standby after the command FFH is input and  $\overline{CE}$  turns to the  $V_{IH}$  level.

Data Recovery Write Timing Waveform

Clear Status Register Timing Waveform

## Function Description

**Status Register:** The HN29V25611A outputs the operation status data as follows: I/O7 pin outputs a  $V_{OL}$  to indicate that the memory is in either erase or program operation. The level of I/O7 pin turns to a  $V_{OH}$  when the operation finishes. I/O5 and I/O4 pins output  $V_{OL}$ s to indicate that the erase and program operations complete in a finite time, respectively. If these pins output  $V_{OH}$ s, it indicates that these operations have timed out. If I/O6 pin outputs  $V_{OH}$ , it indicates a possibility that can be corrected by ECC, choose data correction by ECC or not by reading out the data. When these pins monitor, I/O7 pin must turn to a  $V_{OH}$ . To execute other erase and program operation, the status data must be cleared after a time out occurs. From I/O0 to I/O3 pins are reserved for future use. The pins output  $V_{OL}$ s and should be masked out during the status data read mode. The function of the status register is summarized in the following table.

I/O	Flag definition	Definition
I/O7	Ready/Busy	$V_{OH}$ = Ready, $V_{OL}$ = Busy
I/O6	Program/Erase ECC check	When I/O7 outputs $V_{OH}$ , $V_{OH}$ = ECC available, $V_{OL}$ = ECC not available.
I/O5	Erase check	$V_{OH}$ = Fail, $V_{OL}$ = Pass
I/O4	Program check	$V_{OH}$ = Fail, $V_{OL}$ = Pass
I/O3	Reserved	Outputs a $V_{OL}$ and should be masked out during the status data polling mode.
I/O2	Reserved	
I/O1	Reserved	
I/O0	Reserved	

## ECC Applicability

I/O7	I/O6	I/O5	I/O4	System data correction by ECC
$V_{OH}$	$V_{OH}$	$V_{OH}$	$V_{OL}$	Needed
$V_{OH}$	$V_{OL}$	$V_{OH}$	$V_{OL}$	Not needed. Sector replacement
$V_{OH}$	$V_{OH}$	$V_{OL}$	$V_{OH}$	Needed
$V_{OH}$	$V_{OL}$	$V_{OL}$	$V_{OH}$	Not needed. Sector replacement

This device needs to be corrected failure data by ECC on system or Spare sectors, by reading out again the failure sector data when program/erase error occurs.

Requirement for System

Specifications

Program/Erase Endurance: 10<sup>5</sup> cycles

Item	Min	Typ	Max	Unit
Usable sectors (initially)	16,057	—	16,834	sector
Spare sectors	290	—	—	sector
ECC (Error Correction Code)	3	—	—	bit/sector

Unusable Sector

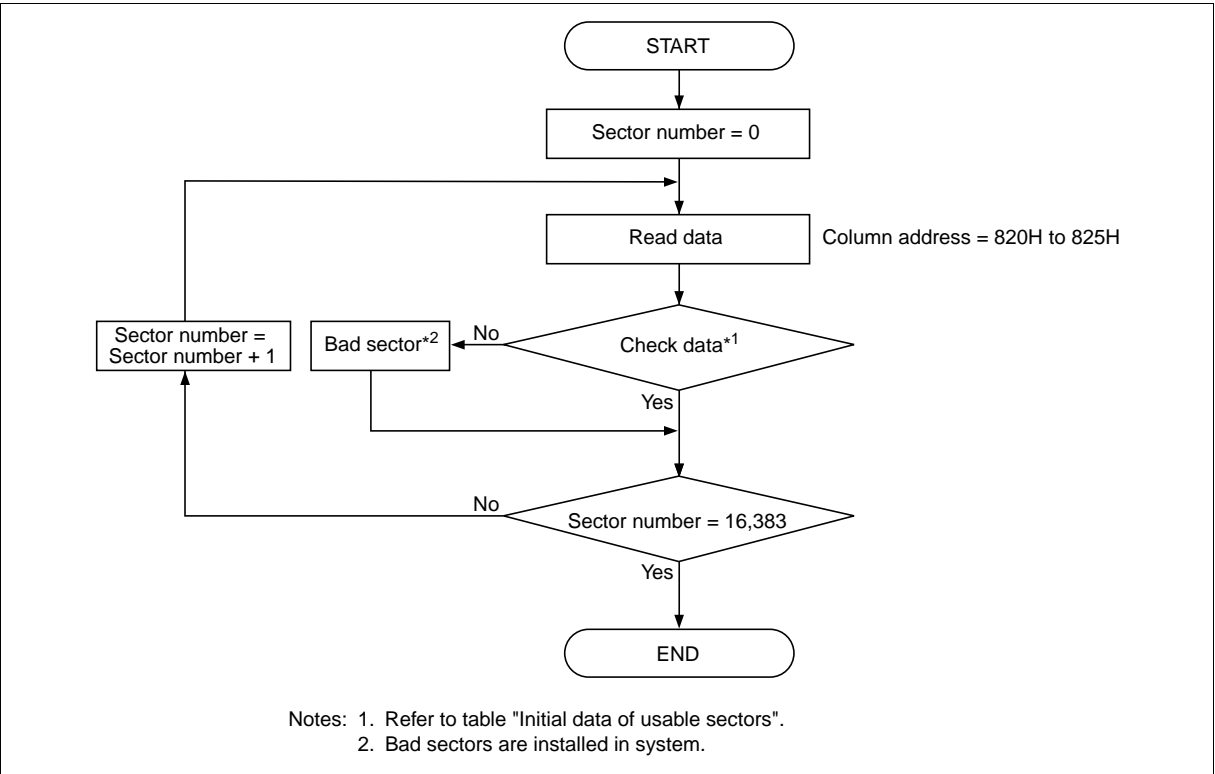

Initially, the HN29V25611A includes unusable sectors. The unusable sectors must be distinguished from the usable sectors by the system as follows.

1. Check the partial invalid sectors in the devices on the system. The usable sectors were programmed the following data. Refer to the flowchart “Indication of unusable sectors”.

Initial Data of Usable Sectors

Column address	0H to 81FH	820H	821H	822H	823H	824H	825H	826H to 83FH
Data	FFH	1CH	71H	C7H	1CH	71H	C7H	FFH

2. Do not erase and program to the partial invalid sectors by the system.

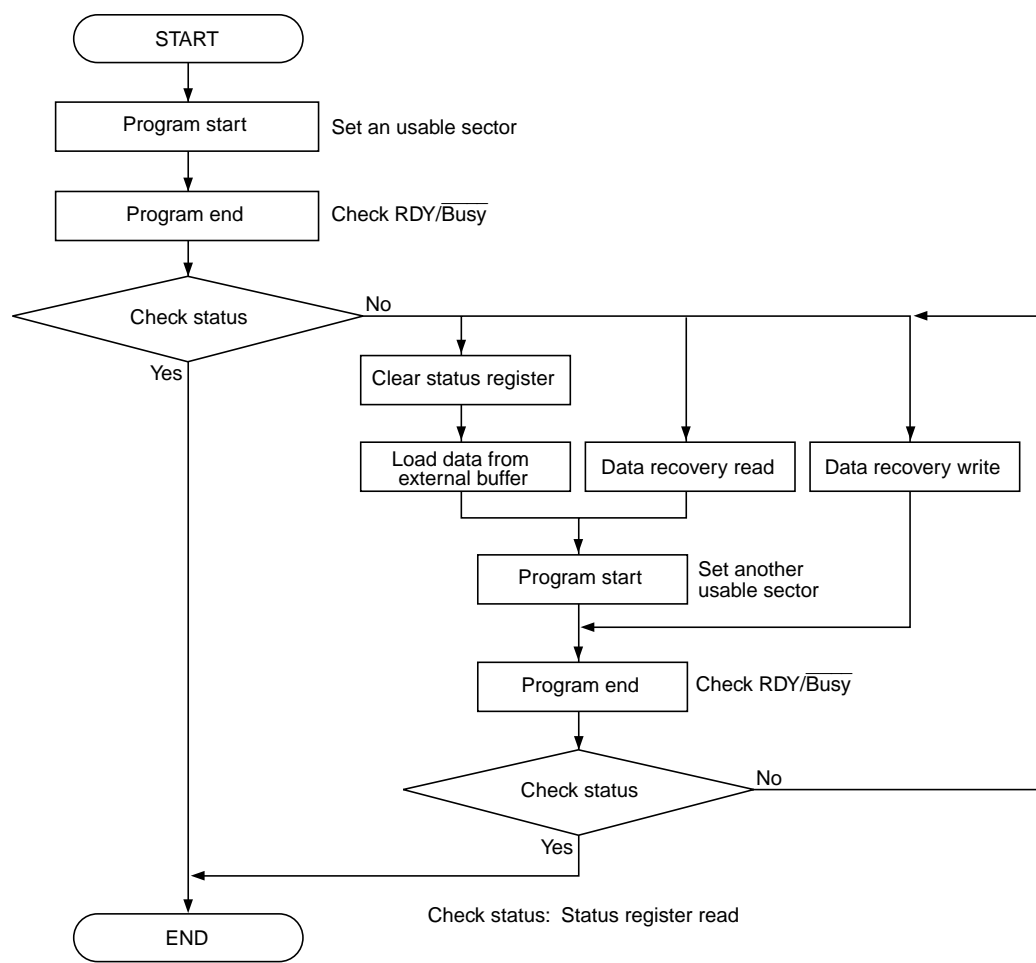

The Unusable Sector Indication Flow

### Requirements for High System Reliability

The device may fail during a program, erase or read operation due to write or erase cycles. The following architecture will enable high system reliability if a failure occurs.

1. For an error in read operation: An ECC (Error Correction Code) or a similar function which can correct 3-bits per each sectors is required for data reliability. When error occurs, data must not be corrected by replacing to spare sector.
2. For errors in program or erase operations: The device may fail during a program or erase operation due to write or erase cycles. The status register indicates if the erase and program operation complete in a finite time. When an error occurred in the sector, try to reprogram the data into another sector. Avoid further system access to the sector that error happens. Typically, recommended number of a spare sectors are 1.8% (290 sectors (min)) of initial usable 16,057 sectors (min) by each device. For the reprogramming, do not use the data from the failed sectors, because the data from the failed sectors are not fixed. So the reprogram data must be the data reloaded from the external buffer, or use the Data recovery read mode or the Data recovery write mode (see the “Mode Description” and under figure “Spare Sector Replacement Flow after Program Error”). To avoid consecutive sector failures, choose addresses of spare sectors as far as possible from the failed sectors. In this case,  $10^5$  cycles of program/erase endurance is guaranteed.

Spare Sector Replacement Flow after Program Error

For Errors in program or erase operations

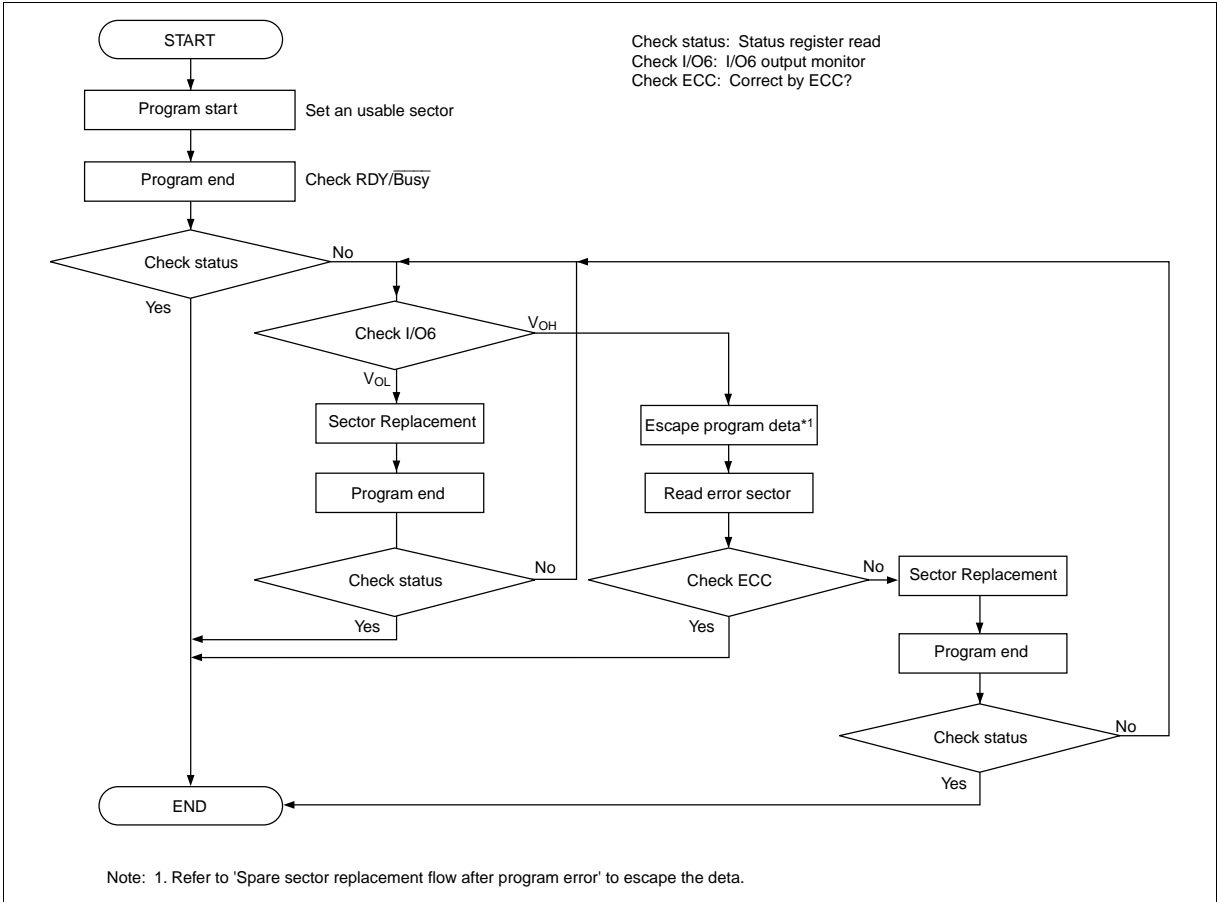

The device may fail during a program or erase operation. Failure mode can be confirmed by read out the status register after complete the erase and program operations. There are two failure modes specified by each codes:

1: Status register error flag:  $I/O6 = V_{OL}$

Replace sector under the “Spare Sectors Replacement Flow at Status Register I/O6 Read”. Replacement must be applied to one sector(2k bytes) which contains failure bits.

2: Status register error flag:  $I/O6 = V_{OH}$

Escape the program data temporary under the “Replacement Flow at Status Register I/O6 Read”. If failure data can be corrected by ECC, do not replace to spare sector. If failure data can not be corrected by ECC, replace to spare sector. Replacement must be applied to one sector(2k bytes) which contains failure bits.

Spare Sectors Replacement Flow at Status Register I/O6 Read

## Memory Structure

Bit: Minimum unit of data.

Byte: Input/output data unit in programming and reading. (1 byte = 8 bits)

Sector: Page unit in erase, programming and reading. (1 sector = 2,112 bytes = 16,896 bits)

Device: 1 device = 16,384 sectors.
