Quick Start

- 1) Connect OUT+, OUT-, LOS+, and LOS- to a 50 Ω -terminated oscilloscope.
- 2) Connect a +2V power supply to VCC, a -1.0V to -3.5V power supply to VEE, and the power supply ground to GND.
- 3) Apply a differential input (2mV_{P-P} to 1.5V_{P-P}) between IN+ and IN-, at a data rate of 155Mbps.
- 4) Shunt jumper JU1 in its right-most position to enable R6 and R7.
- 5) Adjust the LOS threshold with R6 and R7.

Description of Jumpers

Setting the LOS Threshold Resistor

Jumper JU1 controls the resistor used to set the loss-of-signal threshold. To use supplied potentiometers R6 and R7, shunt the right two pins of JU1. If a set resistor is required, solder a resistor to R9 or R10 and shunt the top two pins of JU1 (for R9), or the left two pins of JU1 (for R10).

Enabling Squelch Function

Jumper JU2 (SQUELCH) controls the squelch function. To enable squelch, short the jumper. To disable, leave unconnected.

LOS Threshold

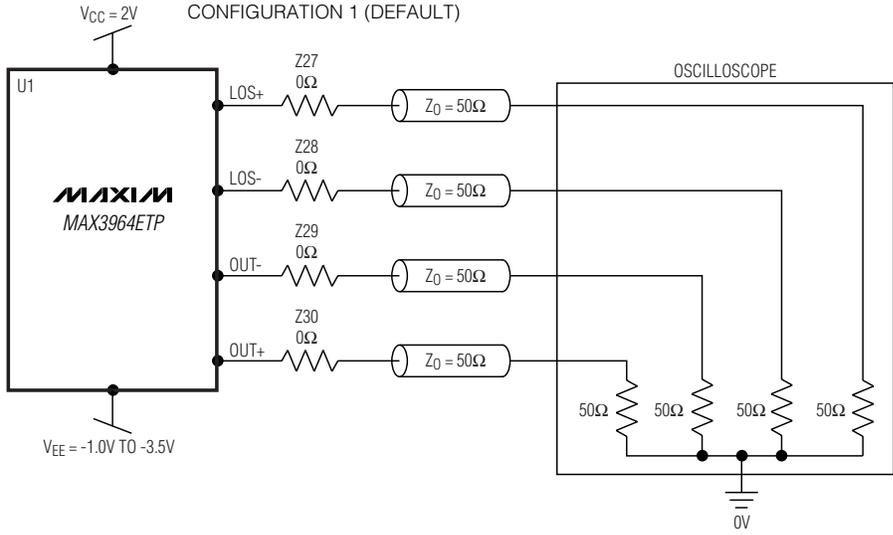

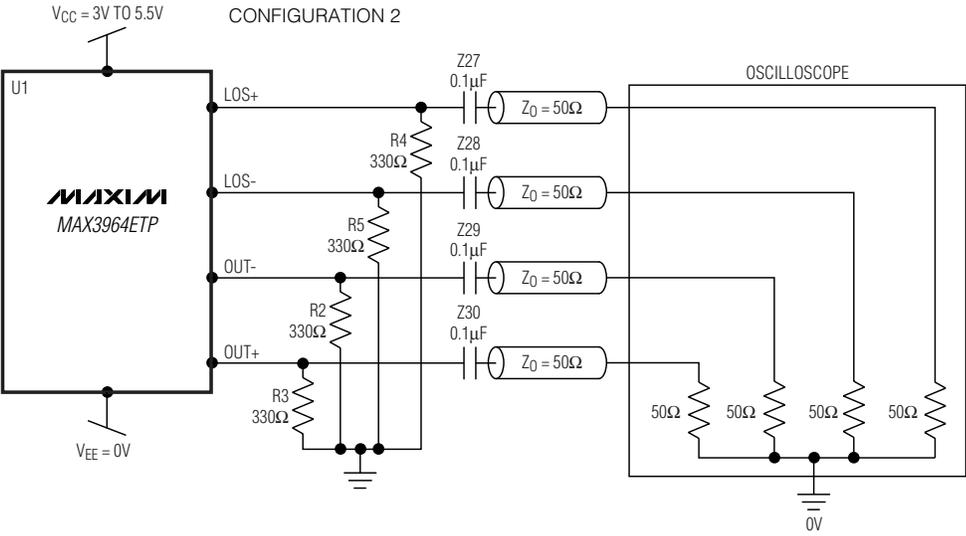

Test point TP3 (VTH) monitors the output of the internal op amp that sets the LOS threshold voltage.

Description of Test Points

Received Signal-Strength Indicator (RSSI)

Test point TP1 (RSSI) monitors the received signal-strength indicator. This pin is an analog voltage proportional to the input signal amplitude.
