

## 25-Bit 1:1 or 14-Bit 1:2 Configurable Registered Buffer

### Features

- PI74 SSTU32864 is designed for low-voltage operation,  $V_{DD} = 1.8V$
- Supports Low Power Standby Operation
- All Inputs are SSTL\_18 Compatible, except  $\overline{RST}$ , C0, C1, which are LVC MOS.
- Output drivers are optimized to drive DDR-II DIMM loads
- Designed for DDR Memory
- Packaging (Pb-free & Green available):  
-96 Ball LFBGA (NB)

### Description

Pericom Semiconductor's PI74SSTU32864 logic circuit is produced using advanced CMOS technology. This 25-Bit 1:1 or 14-Bit 1:2 configurable registered buffer is designed for 1.7V to 1.9V  $V_{DD}$  operation.

All clock and data inputs are compatible with the JEDEC standard for SSTL\_18. The control inputs are LVC MOS. All outputs are 1.8V LVC MOS drivers that have been optimized to drive the DDR-II DIMM load.

The SSTU32864 operates from a differential clock (CK and  $\overline{CK}$ ). Data is registered at the crossing of CK going high, and  $\overline{CK}$  going low.

The C0 input controls the pinout configuration of the 1:2 pinout from A configuration (when LOW) to B configuration (when HIGH). The C1 input controls the pinout configuration for 25-Bit 1:1 (when LOW) to 14-Bit 1:2 (when HIGH).

The device supports low-power standby operation. When the reset input ( $\overline{RST}$ ) is low, the differential input receivers are disabled and undriven (floating) data, clock and reference voltage ( $V_{REF}$ ) inputs are allowed. In addition, when  $\overline{RST}$  is low, all registers are reset, and all outputs are forced low. The LVC MOS  $\overline{RST}$  and Cn inputs must always be held at a valid logic high or low level.

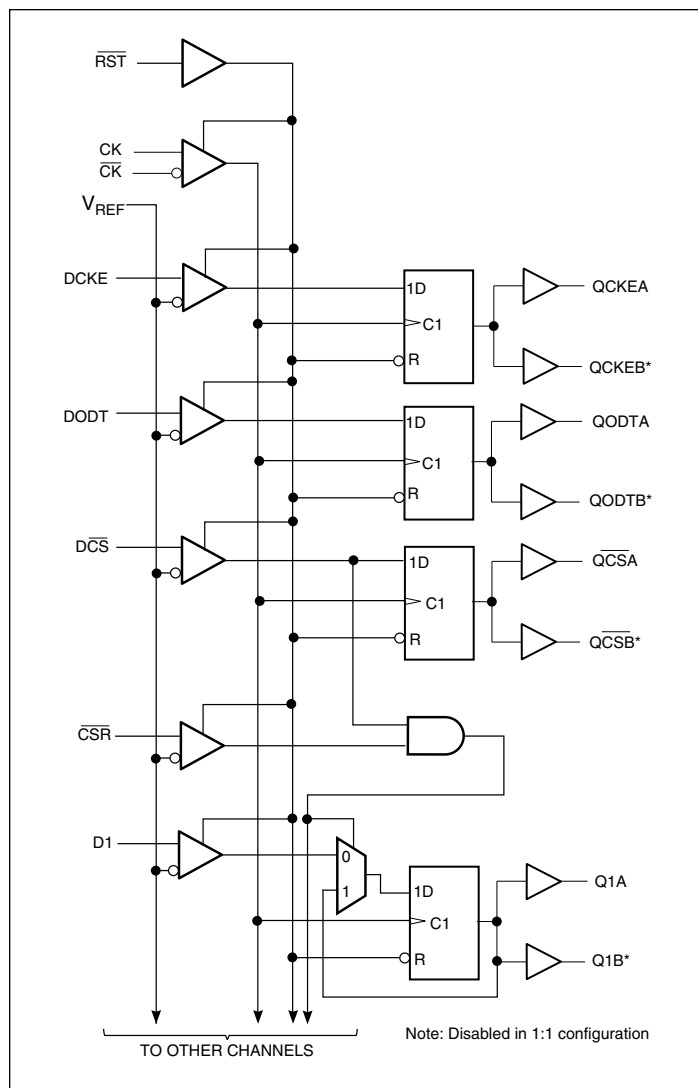

To ensure defined outputs from the register before a stable clock has been supplied,  $\overline{RST}$  must be held in the low state during power up.

In the DDR-II RDIMM application,  $\overline{RST}$  is specified to be completely asynchronous with respect to CK and  $\overline{CK}$ . Therefore, no timing relationship can be guaranteed between the two. When entering reset, the register will be cleared and the outputs will be driven low quickly, relative to the time to disable the differential input receivers. However, when coming out of reset, the register will become active quickly, relative to the time to enable the differential input receivers.

As long as the data inputs are low, and the clock is stable during the time from the low-to-high transition of  $\overline{RST}$  until the input receivers are fully enabled, the design of the SSTU32864 must ensure that the outputs remain low, thus ensuring no glitches on the output.

The device monitors both  $\overline{DCS}$  and  $\overline{CSR}$  inputs and will gate the Qn outputs from changing states when both  $\overline{DCS}$  and  $\overline{CSR}$  inputs are high. If either  $\overline{DCS}$  or  $\overline{CSR}$  input is low, the Qn outputs will function normally. The  $\overline{RST}$  input has priority over the  $\overline{DCS}$  and  $\overline{CSR}$  control will force the outputs low. If the  $\overline{DCS}$  control functionality is not desired, then the CSR input can be hardwired to ground, in which case, the set-up time requirement for  $\overline{DCS}$  would be the same as for the other D data inputs.

## Maximum Ratings

(Above which the useful life may be impaired. For user guidelines, not tested.)

Storage Temperature .....	-65°C to +150°C
Supply Voltage Range, $V_{DD}$ .....	-0.5V to 2.5V
Input Voltage Range, $V_I$ : (See Notes 2 and 3): .....	-0.5V to 2.5V
Output Voltage Range, $V_O$ (See Notes 2 and 3)....	-0.5V to $V_{DD} + 0.5V$
Input Clamp current, $I_{IK}$ ( $V_I < 0$ or $V_I = V_{DD}$ ) .....	-50mA
Output Clamp current, $I_{OK}$ ( $V_O < 0$ or $V_O > V_{DD}$ ).....	±50mA
Continous Output Current, $I_O$ ( $V_O = 0$ to $V_{DD}$ ) .....	±50mA
Continous Current through each $V_{DD}$ or GND.....	±100mA

### Notes:

1. Stresses greater than those listed under MAXIMUM RAININGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
2. The input and output negative-voltage ratings may be exceeded if the input and output clamp-current ratings are observed.
3. This value is limited to 2.5V maximum

## Recommended Operating Conditions<sup>(1)</sup>

Parameters	Description	Min.	Nom.	Max.	Units	
$V_{DD}$	Supply Voltage	1.7		1.9	V	
$V_{REF}$	Reference Voltage	$0.49 \times V_{DD}$	$0.50 \times V_{DD}$	$0.51 \times V_{DD}$		
$V_{TT}$	Termination Voltage	$V_{REF} - 40mA$	$V_{REF}$	$V_{REF} - 40mA$		
$V_I$	Input Voltage	0		$V_{DD}$		
$V_{IH}$	AC High - Level Input Voltage	$V_{REF} 250mV$				
$V_{IL}$	AC Low- Level Input Voltage			$V_{REF} - 250mV$		
$V_{IH}$	DC High - Level Input Voltage	$V_{REF} 125mV$				
$V_{IL}$	DC Low- Level Input Voltage			$V_{REF} - 125mV$		
$V_{IH}$	High Level Input Voltage	$0.65 \times V_{DD}$				
$V_{IL}$	Low Level Input Voltage			$0.35 \times V_{DD}$		
$V_{ICR}$	Common-mode input Voltage	0.675		1.125		
$V_{ID}$	Differential Input Voltage	600				mV
$I_{OH}$	High-Level Output Current			-8		mA
$I_{OL}$	Low-Level Output Current			-8		
$T_A$	Operating Free-air Temperature	0		70	°C	

### Notes:

1. The  $\overline{RST}$  and  $Cn$  inputs of the device must be held at valid levels (not floating) to ensure proper device operation. The differential inputs must not be floating, unless  $\overline{RST}$  is low.

**Electrical Characteristics** Over Recommended Operating Free Air Temperature range

Parameters	Description	Test Conditions	V <sub>DD</sub>	Min.	Nom.	Max.	Units
V <sub>OH</sub>		I <sub>OH</sub> = -6 mA	1.7V	1.2			V

	$\overline{\text{RST}}$	V <sub>I</sub> = V <sub>DD</sub> or GND			2.5		

**Notes:**

- The vendor must supply this value for full device description.

**Timing Requirements** Over Recommended Operating Free Air Temperature range (See Figure 1)

Parameter	Description	Min.	Max	Units
f <sub>clock</sub>	Clock frequency		270	MHz
t <sub>w</sub>	Pulse Duration, CK, $\overline{\text{CK}}$ , High or low	1		ns
t <sub>act</sub> <sup>(1)</sup>	Differential inputs active time <sup>(1)</sup>		10	
t <sub>inact</sub> <sup>(1)</sup>	Differential inputs inactive time <sup>(2)</sup>		15	
t <sub>su</sub>	Setup time	D $\overline{\text{CS}}$ before CK $\uparrow$ , $\overline{\text{CK}}\downarrow$ , $\overline{\text{CSR}}$ high	0.7	
		D $\overline{\text{CS}}$ before CK $\uparrow$ , $\overline{\text{CK}}\downarrow$ , $\overline{\text{CSR}}$ low	0.5	
		$\overline{\text{CSR}}$ DODT, CKE and data before $\overline{\text{CK}}\uparrow$ , CK $\downarrow$	0.5	
t <sub>h</sub>	Hold Time	D $\overline{\text{CS}}$ , $\overline{\text{CSR}}$ DODT, CKE and data before CK $\uparrow$ , $\overline{\text{CK}}\downarrow$	0.5	

**Notes**

- This parameter is not necessarily production tested.
- Data and V<sub>REF</sub> inputs must be a low minimum time of t<sub>act</sub> max, after RST is taken high.
- Data and clock inputs must be held at valid levels (not floating) a minimum time of t<sub>inact</sub> max after RST is taken low.

**Switching Characteristics** Over Recommended Operating Free Air Temperature range (See Figure 1)

Parameters	From (Input)	To (Output)	$V_{DD} = 1.8V \pm 0.1V$		Units
			Min.	Max.	
$f_{max}$			270		MHz
$t_{pdm}$	CK and $\overline{CK}$	Q	1.41 <sup>(3)</sup>	2.15 <sup>(3)</sup>	ns
$t_{pdmss}$ (simultaneous switching) <sup>(1, 2)</sup>	CK and $\overline{CK}$	Q		2.35 <sup>(3)</sup>	
$t_{RPHL}$	$\overline{RST}$	Q	0	3	

**Note:**

1. Includes 350ps test load transmission-line delay.
2. This parameter is not necessarily production tested.
3. For reference only. Final values to be determined.

**Output Edge Rates** Over Recommended Operating Free Air Temperature range (See Figure 2)

Parameters	$V_{DD} = 1.8V \pm 0.1V$		Units
	Min.	Max.	
$dV/dt_r$	1	4	V/ns
$dV/dt_f$	1	4	
$dV/dt^{(1)}$		1	

**Notes:**

1. Difference between  $dV/dt_r$  (rising edge rate) and  $dV/dt_f$  (falling edge rate).

### Test Circuit and Switching Waveforms

Figure 1. Parameter Measurement Information ( $V_{DD} = 1.8V \pm 0.1V$ )

#### Notes:

1.  $C_L$  includes probe and jig capacitance
2.  $I_{DD}$  tested with clock and data inputs held at  $V_{DD}$  or GND and  $I_O = 0mA$
3. All input pulses are supplied by generators having the following characteristics: Pulse Repetition Rate  $\geq 10$  MHz,  $Z_O = 50\Omega$ , input slew rate =  $1V/ns \pm 20\%$  (unless otherwise specified).
4. The outputs are measured one at a time with one transition per measurement.
5.  $V_{REF} = V_{DD}/2$
6.  $V_{IH} = V_{REF} + 250mV$  (ac voltage levels) for differential inputs.  $V_{IH} = V_{DD}$  for LVC MOS input.
7.  $V_{IL} = V_{REF} - 250mV$  (ac voltage levels) for differential inputs.  $V_{IL} = GND$  for LVC MOS input.
8.  $V_{ID} = 600mV$
9.  $t_{PLH}$  and  $t_{PHL}$  are the same as  $t_{pdm}$ .

**Figure 2. Output Slew-Rate Measurement Information ( $V_{DD} = 1.8V \pm 0.1V$ )**

**Notes:**

1.  $C_L$  includes probe and jig capacitance
2. All input pulses are supplied by generators having the following characteristics:  $PRR \leq 10MHz$ ,  $ZO = 50\Omega$ , input slew rate =  $1 V/ns \pm 20\%$  (unless otherwise specified).
