

CY62128V Family

128K x 8 Static RAM

Features

- Low voltage range:
 - 2.7V–3.6V (CY62128V)
 - 2.3V–2.7V (CY62128V25)
 - 1.6V–2.0V (CY62128V18)
- Low active power and standby power
- Easy memory expansion with CE and OE features
- TTL-compatible inputs and outputs
- Automatic power-down when deselected
- CMOS for optimum speed/power

Functional Description

The CY62128V family is composed of three high-performance CMOS static RAMs organized as 131,072 words by 8 bits. Easy memory expansion is provided by an active LOW chip enable (\overline{CE}) and active LOW output enable (\overline{OE}) and

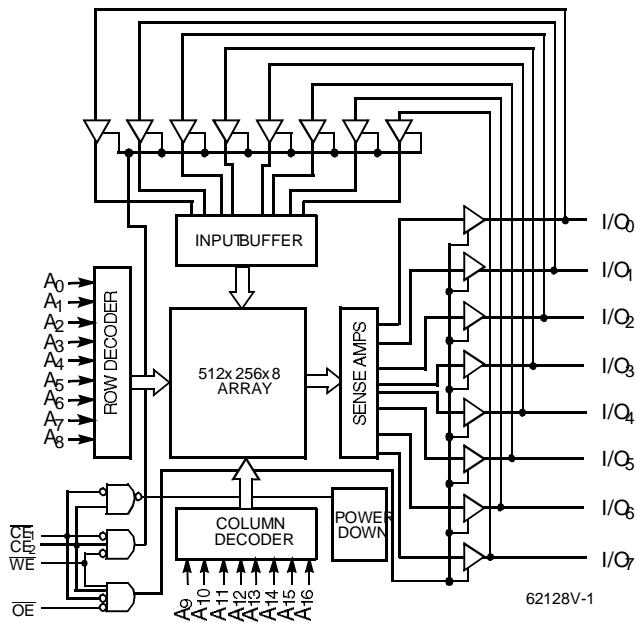

three-state drivers. These devices have an automatic power-down feature, reducing the power consumption by over 99% when deselected. The CY62128V family is available in the standard 450-mil-wide SOIC, TSOP, and STSOP packages.

Writing to the device is accomplished by taking chip enable one (\overline{CE}_1) and write enable (\overline{WE}) inputs LOW and the chip enable two (\overline{CE}_2) input HIGH. Data on the eight I/O pins (I/O_0 through I/O_7) is then written into the location specified on the address pins (A_0 through A_{16}).

Reading from the device is accomplished by taking chip enable one (\overline{CE}_1) and output enable (\overline{OE}) LOW while forcing write enable (\overline{WE}) and chip enable two (\overline{CE}_2) HIGH. Under these conditions, the contents of the memory location specified by the address pins will appear on the I/O pins.

The eight input/output pins (I/O_0 through I/O_7) are placed in a high-impedance state when the device is deselected (\overline{CE}_1 HIGH or \overline{CE}_2 LOW), the outputs are disabled (\overline{OE} HIGH), or during a write operation (\overline{CE}_1 LOW, \overline{CE}_2 HIGH, and \overline{WE} LOW).

Switching Waveforms
Read Cycle No. 1^[10, 11]

62128V-8

Notes:

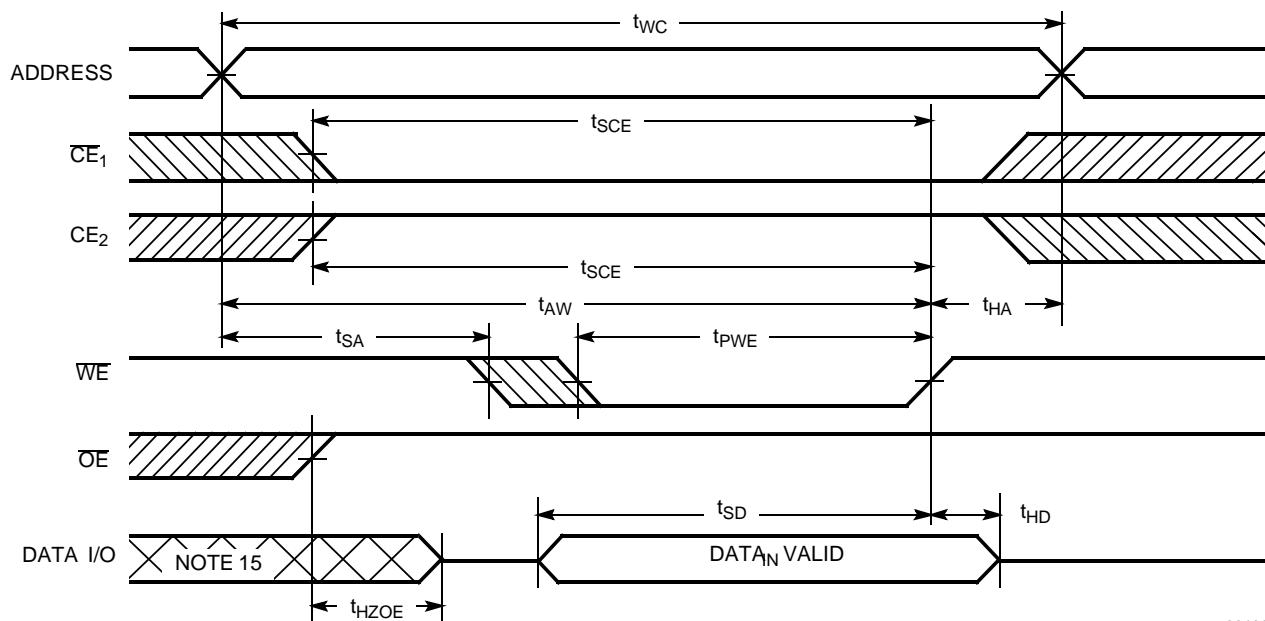

5. Test conditions assume signal transition time of 5 ns or less timing reference levels of 1.5V, input pulse levels of 0 to 3.0V, and output loading of the specified $I_{OL/OH}$ and 100-pF load capacitance.
6. At any given temperature and voltage condition, t_{HZCE} is less than t_{LZCE}, t_{HZOE} is less than t_{LZOE}, and t_{HZWE} is less than t_{LZWE} for any given device.
7. t_{HZOE}, t_{HZCE}, and t_{HZWE} are specified with C_L = 5 pF as in part (b) of AC Test Loads. Transition is measured ± 200 mV from steady-state voltage.
8. The internal write time of the memory is defined by the overlap of CE₁ LOW, CE₂ HIGH and WE LOW. CE₁ and WE signals must be LOW and CE₂ HIGH to initiate a write and either signal can terminate a write by going HIGH. The data input set-up and hold timing should be referenced to the rising edge of the signal that terminates the write.
9. The minimum write cycle time for write cycle #3 (WE controlled, OE LOW) is the sum of t_{HZWE} and t_{SD}.
10. Device is continuously selected. OE, CE = V_{IL}, CE₂ = V_{IH}.
11. WE is HIGH for read cycle.

Switching Waveforms (continued)
Read Cycle No. 2 (\overline{OE} Controlled)^[11,12]

Write Cycle No. 1 (\overline{CE}_1 or \overline{CE}_2 Controlled)^[13,14]

Notes:

12. Address valid prior to or coincident with \overline{CE}_1 transition LOW and \overline{CE}_2 transition HIGH.
13. Data I/O is high impedance if $\overline{OE} = V_{IH}$.
14. If \overline{CE}_1 goes HIGH or \overline{CE}_2 goes LOW simultaneously with \overline{WE} HIGH, the output remains in a high-impedance state.

Switching Waveforms (continued)

Write Cycle No. 2 (\overline{WE} Controlled, \overline{OE} HIGH During Write)^[13,14]

62128V-11

Note:

15. During this period, the I/Os are in output state and input signals should not be applied.
