

DUAL DECADE COUNTER; DUAL 4-STAGE BINARY COUNTER

The SN54/74LS390 and SN54/74LS393 each contain a pair of high-speed 4-stage ripple counters. Each half of the LS390 is partitioned into a divide-by-two section and a divide-by five section, with a separate clock input for each section. The two sections can be connected to count in the 8.4.2.1 BCD code or they can count in a biquinary sequence to provide a square wave (50% duty cycle) at the final output.

Each half of the LS393 operates as a Modulo-16 binary divider, with the last three stages triggered in a ripple fashion. In both the LS390 and the LS393, the flip-flops are triggered by a HIGH-to-LOW transition of their CP inputs. Each half of each circuit type has a Master Reset input which responds to a HIGH signal by forcing all four outputs to the LOW state.

- Dual Versions of LS290 and LS293
- LS390 has Separate Clocks Allowing ÷2, ÷2.5, ÷5
- Individual Asynchronous Clear for Each Counter
- Typical Max Count Frequency of 50 MHz
- Input Clamp Diodes Minimize High Speed Termination Effects

CONNECTION DIAGRAM DIP (TOP VIEW)

NOTE:
The Flatpak version has the same pinouts (Connection Diagram) as the Dual In-Line Package.

PIN NAMES

$\overline{\text{CP}}$	Clock (Active LOW going edge)
	Input to +16 (LS393)
$\overline{\text{CP}}_0$	Clock (Active LOW going edge)
	Input to +2 (LS390)
$\overline{\text{CP}}_1$	Clock (Active LOW going edge)
	Input to +5 (LS390)
MR	Master Reset (Active HIGH) Input
Q_0-Q_3	Flip-Flop outputs (Note b)

LOADING (Note a)

	HIGH	LOW
$\overline{\text{CP}}$	0.5 U.L.	1.0 U.L.
$\overline{\text{CP}}_0$	0.5 U.L.	1.0 U.L.
$\overline{\text{CP}}_1$	0.5 U.L.	1.5 U.L.
MR	0.5 U.L.	0.25 U.L.
Q_0-Q_3	10 U.L.	5 (2.5) U.L.

NOTES:

a) 1 TTL Unit Load (U.L.) = 40 μA HIGH/1.6 mA LOW.

b) The Output LOW drive factor is 2.5 U.L. for Military (54) and 5 U.L. for Commercial (74) Temperature Ranges.

FUNCTIONAL DESCRIPTION

Each half of the SN54/74LS393 operates in the Modulo 16 binary sequence, as indicated in the +16 Truth Table. The first flip-flop is triggered by HIGH-to-LOW transitions of the CP input signal. Each of the other flip-flops is triggered by a HIGH-to-LOW transition of the Q output of the preceding flip-flop. Thus state changes of the Q outputs do not occur simultaneously. This means that logic signals derived from combinations of these outputs will be subject to decoding spikes and, therefore, should not be used as clocks for other counters, registers or flip-flops. A HIGH signal on MR forces all outputs to the LOW state and prevents counting.

Each half of the LS390 contains a +5 section that is independent except for the common MR function. The +5

section operates in 4.2.1 binary sequence, as shown in the +5 Truth Table, with the third stage output exhibiting a 20% duty cycle when the input frequency is constant. To obtain a +10 function having a 50% duty cycle output, connect the input signal to CP_1 and connect the Q_3 output to the CP_0 input; the Q_0 output provides the desired 50% duty cycle output. If the input frequency is connected to CP_0 and the Q_0 output is connected to CP_1 , a decade divider operating in the 8.4.2.1 BCD code is obtained, as shown in the BCD Truth Table. Since the flip-flops change state asynchronously, logic signals derived from combinations of LS390 outputs are also subject to decoding spikes. A HIGH signal on MR forces all outputs LOW and prevents counting.
