Si Push Pull, 40 – 870MHz, 18.5dB min. Gain @ 870MHz, 240mA max. @ 24VDC

FEATURES

- Excellent linearity
- Superior return loss performance
- Extremely low distortion
- Optimal reliability
- Low noise
- Unconditionally stable under all terminations

APPLICATION

- 40 to 870 MHz CATV amplifier systems

DESCRIPTION

- Hybrid Push Pull amplifier module employing silicon dice

LIMITING VALUES

In accordance with the Absolute Maximum Rating System (IEC 60134)

SYMBOL	PARAMETER	MIN.	MAX.	UNIT
V _i	RF input voltage (single tone)	-	70	dBmV

Si Push Pull, 40 – 870MHz, 18.5dB min. Gain @ 870MHz, 240mA max. @ 24VDC

Notes:

- 1) The slope is defined as the difference between the 'ideal gain' at the start frequency and the 'ideal gain' at the stop frequency.
- 2) The gain flatness is the deviation of any amplitude value from the ideal gain curve calculated by the following mathematical model: $Gain = G + C \cdot \sqrt{f_x/f_1}$.
 G = constant gain (frequency independent); C = cable constant; f_x = desired frequency; f_1 = start frequency. The cable constant C must be optimized during the flatness determination so that the curve best fits the measured gain figures. The start value for C is calculated using the formula $C_{start} = (G_n - G_1) / (\sqrt{f_n/f_1} - 1)$, where G_n = the measured gain at the stop frequency, G_1 = the measured gain at the start frequency and f_n = stop frequency. The value of G is chosen so that the max. positive deviation of the measured gain from the 'ideal gain' curve is the same as the max. negative deviation. The value of C is adapted by ± 0.001 until the 'ideal gain' curve best fits the measured curve. The flatness of the module gain is the maximum deviation in measured gain from the optimized gain formula.

Composite Second Order (CSO)

The CSO parameter (both sum and difference products) is defined by the NCTA.

Composite Triple Beat (CTB)

The CTB parameter is defined by the NCTA.

Cross Modulation (XMOD)

Cross modulation (XMOD) is measured at baseband (selective voltmeter method), referenced to 100% modulation of the carrier being tested.

DEFINITIONS

Data Sheet Status	
Objective Product Specification	This data sheet contains target or goal specifications for product development.
Preliminary Product Specification	This data sheet contains preliminary data; supplementary data may be published later.
Product Specification	This data sheet contains final product specifications.
Limiting values	
Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 60134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.	
Application information	
Where application information is given, it is advisory and does not form part of the specification.
