

ICS667-01

HDTV CLOCK SYNTHESIZER

Description

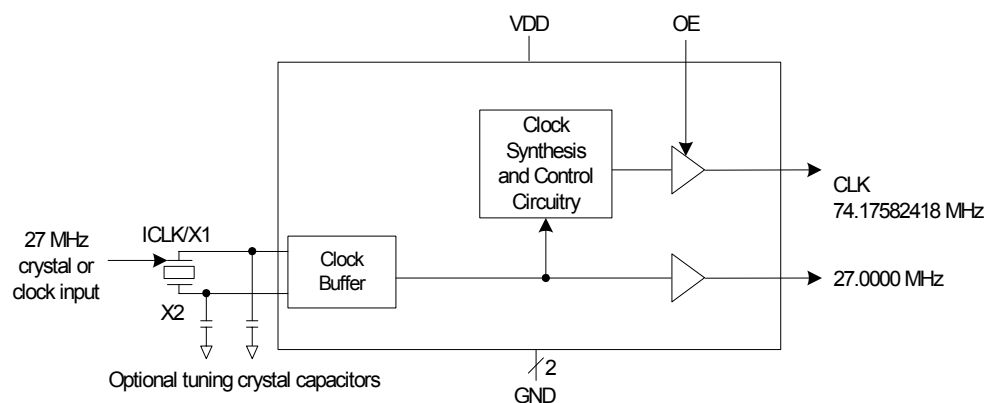

The ICS667-01 is a low-cost, low jitter, high-performance PLL clock synthesizer designed to produce the 74.176 MHz clock necessary for HDTV systems. Using ICS' patented analog Phase-Locked Loop (PLL) techniques, the device accepts a 27 MHz crystal or clock input. The zero ppm synthesis error exactly locks the display to the digital stream.

ICS manufactures the largest variety multimedia clock synthesizers for all applications. Consult ICS to eliminate crystals and oscillators from your board.

Features

- Packaged in 8-pin SOIC
- Available in Pb (lead) free package
- Input frequency of 27 MHz
- Zero ppm synthesis error in output clock
- 3.3 V $\pm 5\%$ operating supply
- Ideal for HDTV applications and oscillator manufacturers
- Advanced, low power, sub-micron CMOS process

Pin Descriptions

Pin Number	Pin Name	Pin Type	Pin Description
1	ICLK/X1	XI	Crystal connection. Connect to a 27 MHz fundamental crystal or clock.
2	VDD	Power	Connect to +3.3 V.
3	GND	Power	Connect to ground.
4	CLK	Output	74.17582418 MHz.
5	GND	Power	Connect to ground.
6	OE	Input	Output enable. Tri-states CLK output when low. Internal pull-up to VDD.
7	27M	Output	27 MHz buffered clock or crystal oscillator output.
8	X2	XO	Crystal connection. Connect to a 27 MHz crystal, or leave unconnected for clock input.

External Components

Decoupling Capacitor

As with any high performance mixed-signal IC, the ICS667-01 must be isolated from system power supply noise to perform optimally.

A decoupling capacitor of 0.01 μ F must be connected between VDD and GND on pins 2 and 3. It must be connected close to the ICS667-01 to minimize lead inductance. Pin 5 can be connected to pin 3. No external power supply filtering is required for the ICS667-01.

Series Termination Resistor

A 33 Ω terminating resistor can be used next to the clock outputs for trace lengths over one inch.

Crystal Load Capacitors

The total on-chip capacitance is approximately 18 pF. A parallel resonant, fundamental mode, AT cut 27 MHz

crystal should be used. The device crystal connections should include pads for small capacitors from X1 to ground and from X2 to ground. These capacitors are used to adjust the stray capacitance of the board to match the nominally required crystal load capacitance. Because load capacitance can only be increased in this trimming process, it is important to keep stray capacitance to a minimum by using very short PCB traces (and no vias) between the crystal and device. Crystal capacitors, if needed, must be connected from each of the pins X1 and X2 to ground.

The value (in pF) of these crystal caps should equal $(C_L - 16 \text{ pF}) \times 2$. In this equation, C_L = crystal load capacitance in pF. Example: For a crystal with an 18 pF load capacitance, each crystal capacitor would be 4 pF $[(18 - 16) \times 2] = 4$.

Absolute Maximum Ratings

Stresses above the ratings listed below can cause permanent damage to the ICS667-01. These ratings, which are standard values for ICS commercially rated parts, are stress ratings only. Functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods can affect product reliability. Electrical parameters are guaranteed only over the recommended operating temperature range.
