

Adjustable Precision shunt Regulator

■ Features

- Precision reference voltage
 - CP431 : 2.495V \pm 1%
 - CP431A : 2.495V \pm 0.5%
- Sink current capability: 200mA
- Minimum cathode current for regulation: 300 μ A
- Equivalent full-range temp. coefficient: 30 ppm/ $^{\circ}$ C
- Fast turn-on response
- Low dynamic output impedance: 0.2 Ω
- Programmable output voltage to 36v
- Low output noise.
- Packages: TO92,SOT23

■ Description

The CP431/CP431A are 3-terminal adjustable precision shunt regulators with guaranteed temperature stability over the applicable extended commercial temperature range. The output voltage may be set at any level greater than 2.495V(V_{REF}) up to 36V merely by selecting two external resistors that act as a voltage divider network. These devices have a typical output impedance of 0.2 Ω . Active output circuitry provides a very sharp turn-on characteristics, making these devices excellent improved replacements for Zener diodes in many applications. The precise (+/-) 1% Reference voltage tolerance of the AP431/431A make it possible in many applications to avoid the use of a variable resistor, consequently saving cost and eliminating drift and reliability problems associated with it.

■ Typical Application Circuit

$$V_{OUT} = (1 + R1/R2)V_{REF}$$

Note . Deviation of reference input voltage, V_{DEV} , is defined as the maximum variation of the reference over the full temperature range.

The average temperature coefficient of the reference input voltage αV_{REF} is defined as:

$$|\alpha V_{REF}| = \frac{\left(\frac{V_{DEV}}{V_{REF}(25^{\circ}\text{C})}\right) \cdot 10^6}{T_2 - T_1} \dots\dots\dots (\text{ppm}/^{\circ}\text{C})$$

Where:

$T_2 - T_1$ = full temperature change.

αV_{REF} can be positive or negative depending on whether the slope is positive or negative.

Note 4. The dynamic output impedance, R_Z , is defined as:

$$|Z_{KA}| = \frac{\Delta V_{KA}}{\Delta I_{KA}}$$

When the device is programmed with two external resistors R_1 and R_2 (see Figure 2.), the dynamic output impedance of the overall circuit, is defined as:

$$|Z_{KA}'| = \frac{\Delta v}{\Delta i} \approx |Z_{KA}| \cdot \left(1 + \frac{R_1}{R_2}\right)$$
