

### FEATURES

- Operate with 3.3 V supply
- Interoperable with 5 V logic
- EIA RS-422 and RS-485 compliant over full common-mode range
- Data rate options
  - ADM3483/ADM3488: 250 kbps
  - ADM3485/ADM3490/ADM3491: 10 Mbps
- Half- and full-duplex options
- Reduced slew rates for low EMI (ADM3483 and ADM3488)
- 2 nA supply current in shutdown mode (ADM3483/ADM3485/ADM3491)
- Up to 32 transceivers on the bus
- 7 V to +12 V bus common-mode range
- Specified over the -40°C to +85°C temperature range
- 8 ns skew (ADM3485/ADM3490/ADM3491)
- 8-lead SOIC and 14-lead SOIC (ADM3491 only) packages

### APPLICATIONS

- Low power RS-485/RS-422 applications
- Telecom
- Industrial process control
- HVAC

### GENERAL DESCRIPTION

The ADM3483/ADM3485/ADM3488/ADM3490/ADM3491 are low power, differential line transceivers designed to operate using a single 3.3 V power supply. Low power consumption, coupled with a shutdown mode, makes the ADM3483/ADM3485/ADM3488/ADM3490/ADM3491 ideal for power-sensitive applications.

The ADM3488/ADM3490/ADM3491 feature full-duplex communication, while the ADM3483/ADM3485 are designed for half-duplex communication.

The ADM3483/ADM3488 feature slew rate limited drivers that minimize EMI and reduce reflections caused by improperly terminated cables, allowing error-free data transmission at data rates up to 250 kbps.

The ADM3485/ADM3490/ADM3491 transmit at up to 10 Mbps. The receiver input impedance is 12 k $\Omega$ , allowing up to 32 transceivers to be connected on the bus. A thermal shutdown circuit prevents excessive power dissipation caused by bus contention or by output shorting. If a significant temperature increase is detected

in the internal driver circuitry during fault conditions, then the thermal shutdown circuit forces the driver output into a high impedance state. If the inputs are unconnected (floating), the receiver contains a fail-safe feature that results in a logic high output state. The parts are fully specified over the commercial and industrial temperature ranges. The ADM3483/ADM3485/ADM3488/ADM3490 are available in 8-lead SOIC\_N; the ADM3491 is available in a 14-lead SOIC\_N.

Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

### ESD CAUTION

**ESD (electrostatic discharge) sensitive device.** Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

## CIRCUIT DESCRIPTION

The ADM3483/ADM3485/ADM3488/ADM3490/ADM3491 are low power transceivers for RS-485 and RS-422 communications. The ADM3483/ADM3488 transmit and receive at data rates up to 250 kbps; the ADM3485/ADM3490/ADM3491 transmit at up to 10 Mbps. The ADM3488/ADM3490/ADM3491 are full-duplex transceivers, while the ADM3483/ADM3485 are half-duplex transceivers. Driver enable (DE) and receiver enable ( $\overline{\text{RE}}$ ) pins are included on the ADM3483/ADM3485/ADM3491. When disabled, the driver and receiver outputs are high impedance.

### REDUCED EMI AND REFLECTIONS— ADM3483/ADM3488

The ADM3483/ADM3488 are slow rate limited transceivers, minimizing EMI and reducing reflections caused by improperly terminated cables.

### LOW POWER SHUTDOWN MODE (ADM3483/ADM3485/ADM3491)

A low power shutdown mode is initiated by bringing  $\overline{\text{RE}}$  high and DE low. The devices do not shut down unless both the driver and receiver are disabled (high impedance). In shutdown mode, the devices typically draw only 2 nA of supply current. For these devices, the  $t_{\text{PSH}}$  and  $t_{\text{PSL}}$  enable times assume the part is in the low power shutdown mode; the  $t_{\text{PZH}}$  and  $t_{\text{PZL}}$  enable times assume the receiver or driver was disabled, but the part is not shut down.

### DRIVER OUTPUT PROTECTION

Two methods are implemented to prevent excessive output current and power dissipation caused by faults or by bus contention. Current limit protection on the output stage provides immediate protection against short circuits over the whole common-mode voltage range (see the Typical Performance Characteristics section). In addition, a thermal shutdown circuit forces the driver outputs into a high impedance state if the die temperature rises excessively.

### PROPAGATION DELAY

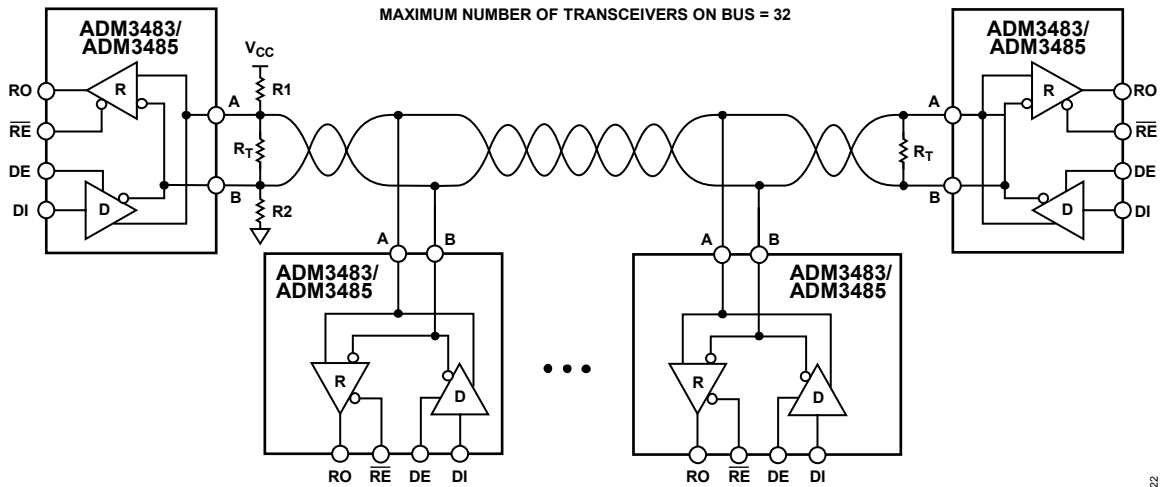

Skew time is the difference between the low-to-high and high-to-low propagation delays. Small driver/receiver skew times help maintain a symmetrical mark-space ratio (50% duty cycle). The receiver skew time ( $|t_{\text{PRLH}} - t_{\text{PRHL}}|$ ) is under 10 ns (20 ns for ADM3483/ADM3488). The driver skew times are 8 ns for ADM3485/ADM3490/ADM3491 and typically under 100 ns for ADM3483/ADM3488.

### TYPICAL APPLICATIONS

The ADM3483/ADM3485/ADM3491 transceivers are designed for half-duplex bidirectional data communications on multipoint bus transmission lines, Figure 32 and Figure 33 show typical network applications circuits. The ADM3488 and the ADM3490 full-duplex transceivers are designed to be used in a daisy-chain network topology or in a point-to-point application, see Figure 34 and Figure 35. The ADM3491 can be used as line repeat Figure 36. To minimize reflections, the line must be terminated at both ends in its characteristic impedance, and stub lengths off the main line must be kept as short as possible. The slow rate limited ADM3483/ADM3488 are more tolerant of imperfect termination.

## LINE LENGTH VS. DATA RATE

The RS-485 and RS-422 standards cover line lengths up to 4000 feet. For line lengths greater than 4000 feet, see Figure 36.
