

40V 3.5A quad power half bridge

Feature

- Multipower BCD technology
- Minimum input output pulse width distortion
- 200mΩ R_{dsON} complementary dmos output stage
- CMOS compatible logic inputs
- Thermal protection
- Thermal warning output
- Under voltage protection
- Short circuit protection

Description

STA518 is a monolithic quad half bridge stage in Multipower BCD Technology. The device can be used also as dual bridge or reconfigured, by connecting CONFIG pin to Vdd pin, as single bridge with double current capability.

The device is particularly designed to make the output stage of a stereo All-Digital High Efficiency (DDX™) amplifier capable to deliver an output power of 24W x 4 channels @ THD = 10% at Vcc 30V on 4W load in single ended configuration. It can also deliver 50 + 50W @ THD = 10% at Vcc 29V as output power on 8W load in BTL configuration and 70W @ THD = 10% at Vcc 34V on 8W in single paralleled BTL configuration.

The input pins have threshold proportional to VL pin voltage.

14	GND1A	Negative Supply
15	Vcc1A	Positive supply
16 ; 17	OUT1A	Output half bridge 1A
35 ; 36	Vcc Sign	Signal Positive supply

Table 1. Pin Function (continued)

N°	Pin	Description
18	NC	Not connected
19	GND-clean	Logical ground
20	GND-Reg	Ground for regulator Vdd
21 ; 22	Vdd	5V Regulator referred to ground
23	VL	Logic Reference Voltage
24	CONFIG	Configuration pin
25	PWRDN	Stand-by pin
26	TRI-STATE	Hi-Z pin
27	FAULT	Fault pin advisor
28	TH-WAR	Thermal warning advisor
29	IN1A	Input of half bridge 1A
30	IN1B	Input of half bridge 1B
31	IN2A	Input of half bridge 2A
32	IN2B	Input of half bridge 2B
33 ; 34	Vss	5V Regulator referred to +Vcc
35 ; 36	Vcc Sign	Signal Positive supply

Table 2. Functional Pin Status

Pin Name	Pin N.	Logical value	IC - STATUS
FAULT	27	0	Fault detected (Short circuit, or Thermal.)
FAULT *	27	1	Normal Operation
TRI-STATE	26	0	All powers in Hi-Z state
TRI-STATE	26	1	Normal operation
PWRDN	25	0	Low consumption
PWRDN	25	1	Normal operation
THWAR	28	0	Temperature of the IC =130C
THWAR ⁽¹⁾	28	1	Normal operation
CONFIG	24	0	Normal Operation
CONFIG ⁽²⁾	24	1	OUT1A=OUT1B ; OUT2A=OUT2B (IF IN1A = IN1B; IN2A = IN2B)

1. The pin is open collector. To have the high logic value, it needs to be pulled up by a resistor.
2. To put CONFIG = 1 means connect Pin 24 (CONFIG) to Pins 21, 22 (Vdd) to implemented single BTL (MONO MODE) operation for high current.

3 Electrical specifications

3.1 Absolute maximum ratings

Table 3. Absolute maximum ratings

Symbol	Parameter	Value	Unit
V_{CC}	DC Supply Voltage (Pin 4,7,12,15)	40	V
V_{max}	Maximum Voltage on pins 23 to 32	5.5	V
T_{op}	Operating Temperature Range	-40 to 90	°C
P_{tot}	Power Dissipation (Tcase = 70°C)	21	W
T_{stg}, T_j	Storage and Junction Temperature	-40 to 150	°C

3.2 Recommended operating conditions

Table 4. Recommended operating conditions (*)

Symbol	Parameter	Min.	Typ.	Max.	Unit
V_{CC}	DC Supply Voltage	10		36.0	V
V_L	Input Logic Reference	2.7	3.3	5.0	V
T_{amb}	Ambient Temperature	0		70	°C

(*) performances not guaranteed beyond recommended operating conditions

3.3 Thermal data

Table 5. Thermal data (*)

Symbol	Parameter	Min.	Typ.	Max.	Unit
T_{j-case}	Thermal Resistance Junction to Case (thermal pad)			1.5	°C/W
T_{jSD}	Thermal shut-down junction temperature		150		°C
T_{warn}	Thermal warning temperature		130		°C
t_{hSD}	Thermal shut-down hysteresis		25		°C

(*) see Thermal information

3.4 Thermal information

The power dissipated within the device depends primarily on the supply voltage, load impedance and output modulation level. The PSSO36 Package of the STA518 includes an exposed thermal slug on the top of the device to provide a direct thermal path from the IC to the heatsink. For the Quad single ended application the Dissipated Power vs Output Power is shown in [Figure 10](#).

Considering that for the STA518 the Thermal resistance Junction to slug is $1.5^{\circ}\text{C}/\text{W}$ and the estimated Thermal resistance due to the grease placed between slug and heat sink is $2.3^{\circ}\text{C}/\text{W}$ (the use of thermal pads for this package is not recommended), the suitable Heat Sink R_{th} to be used can be drawn from the following graph [Figure 11](#), where is shown the Derating Power vs. T_{amb} for different heatsinkers.

3.5 Electrical characteristics

Table 6. Electrical Characteristics

Refer to circuit in [Figure 3](#) ($V_L = 3.3\text{V}$; $V_{CC} = 30\text{V}$; $R_L = 8\Omega$; $f_{sw} = 384\text{KHz}$; $T_{amb} = 25^{\circ}\text{C}$ unless otherwise specified)

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit

4 Technical information

The STA518 is a dual channel H-Bridge that is able to deliver 50W per channel (@ THD=10% $R_L = 8\Omega$, $V_{CC} = 29V$) of audio output power in high efficiency.

The STA518 converts both DDX and binary-controlled PWM signals into audio power at the load. It includes a logic interface, integrated bridge drivers, high efficiency MOSFET outputs and thermal and short circuit protection circuitry.

In DDX mode, two logic level signals per channel are used to control high-speed MOSFET switches to connect the speaker load to the input supply or to ground in a Bridge configuration, according to the damped ternary Modulation operation.

In Binary Mode operation, both Full Bridge and Half Bridge Modes are supported. The STA518 includes over-current and thermal protection as well as an under-voltage

Lockout with automatic recovery. A thermal warning status is also provided.

Figure 6. STA518 Block Diagram Full-Bridge DDX® or Binary Modes

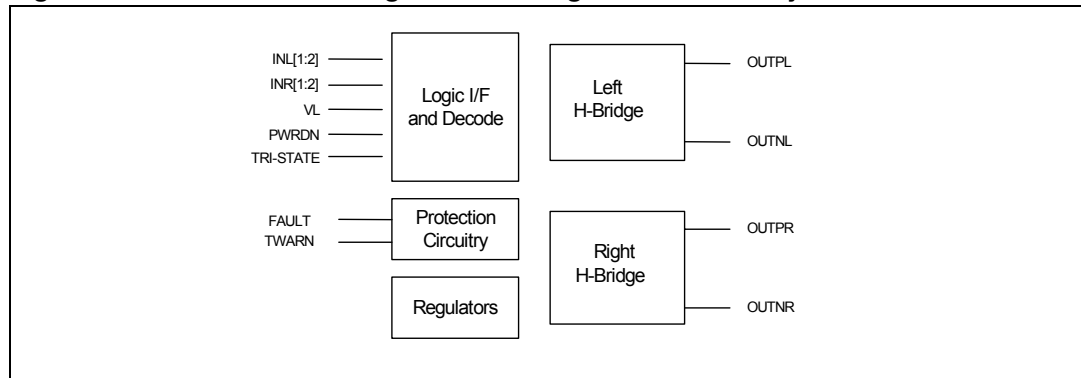

Figure 7. STA518 Block Diagram Binary Half-Bridge Mode

4.1 Logic interface and decode:

The STA518 power outputs are controlled using one or two logic level timing signals. In order to provide a proper logic interface, the Vbias input must operate at the same voltage as the DDX control logic supply.

Protection circuitry:

The STA518 includes protection circuitry for over-current and thermal overload conditions. A thermal warning pin (pin.28) is activated low (open drain MOSFET) when the IC temperature exceeds 130°C, in advance of the thermal shutdown protection. When a fault condition is detected, an internal fault signal acts to immediately disable the output power MOSFETs, placing both H-Bridges in high impedance state. At the same time an open-drain MOSFET connected to the fault pin (pin.27) is switched on.

There are two possible modes subsequent to activating a fault:

1. **SHUTDOWN mode:** with FAULT (pull-up resistor) and TRI-STATE pins independent, an activated fault will disable the device, signaling low at the FAULT output. The device may subsequently be reset to normal operation by toggling the TRI-STATE pin from High to Low to High using an external logic signal.
2. **AUTOMATIC recovery mode:** This is shown in the Audio Application Circuit of Quad single Ended). The FAULT and TRI-STATE pins are shorted together and connected to a time constant circuit comprising R59 and C58. An activated FAULT will force a reset on the TRI-STATE pin causing normal operation to resume following a delay determined by the time constant of the circuit. If the fault condition is still present, the circuit operation will continue repeating until the fault condition is removed. An increase in the time constant of the circuit will produce a longer recovery interval. Care must be taken in the overall system design as not to exceed the protection thresholds under normal operation.

4.2 Power outputs:

The STA518 power and output pins are duplicated to provide a low impedance path for the device's bridged outputs. All duplicate power, ground and output pins must be connected for proper operation.

The PWRDN or TRI-STATE pins should be used to set all MOSFETS to the Hi-Z state during power-up until the logic power supply, V_L , is settled.

4.3 Parallel output / high current operation:

When using DDX Mode output, the STA518 outputs can be connected in parallel in order to increase the output current capability to a load. In this configuration the STA518 can provide 70W into 8 ohm.

This mode of operation is enabled with the CONFIG pin (pin.24) connected to VREG1 and the inputs combined INLA=INLB, INRA=INRB and the outputs combined OUTLA=OTLB, OUTRA=OUTRB.

4.4 Additional informations:

Output Filter: A passive 2nd-order passive filter is used on the STA518 power outputs to reconstruct an analog Audio Signal. System performance can be significantly affected by the output filter design and choice of passive components. A filter design for 6ohm/8ohm loads is shown in the Typical Application circuit of [Figure 9](#).

Quad Single ended circuit ([Figure 1](#)) shows a filter for ½ bridge mode, 4 ohm loads.

Figure 8. Typical Stereo Full Bridge Configuration to Obtain 50+50W @ THD = 10%, $R_L = 8\Omega$, $V_{CC} = 29V$

Figure 9. Typical Single BTL Configuration to Obtain 70W @ THD 10%, $R_L = 8\Omega$, $V_{CC} = 34V$ (note 1)

Note: 1 "A PWM modulator as driver is needed . In particular, this result is performed using the STA308+STA518+STA50X demo board". Peak Power for $t \leq 1\text{sec}$

5 Characterization curves

The following characterization are obtained using the quad single ended configuration (*Figure 1*) with STA308A controller

6 Package information

In order to meet environmental requirements, ST offers these devices in ECOPACK[®] packages. These packages have a Lead-free second level interconnect. The category of second Level Interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label. ECOPACK is an ST trademark. ECOPACK specifications are available at: www.st.com.
