Notes:
1. Transition is measured ±200 mV from steady voltage with Load (B). This parameter is sampled and not 100% tested.
2. If the $\overline{CS}$ or $\overline{LB}$ or $\overline{UB}$ low transition occurs simultaneously with the $\overline{WE}$ low transition or after the $\overline{WE}$ transition, output remains a high impedance state.
3. $\overline{WE}$ and/or $\overline{CS}$ must be high during address transition time.
4. If $\overline{CS}$, $\overline{OE}$, $\overline{LB}$ and $\overline{UB}$ are low during this period, I/O pins are in the output state. Then the data input signals of opposite phase to the outputs must not be applied to them.
5. t_{AS} is measured from the latest address transition to the latest of $\overline{CS}$, $\overline{WE}$, $\overline{LB}$ or $\overline{UB}$ going low.
6. t_{WR} is measured from the earliest of $\overline{CS}$, $\overline{WE}$, $\overline{LB}$ or $\overline{UB}$ going high to the first address transition.
7. A write occurs during the overlap of low $\overline{CS}$, low $\overline{WE}$ and low $\overline{LB}$ or low $\overline{UB}$.
8. t_{CW} is measured from the later of $\overline{CS}$ going low to the end of write.
9. t_{LBW} is measured from the later of $\overline{LB}$ going low to the end of write.
10. t_{UBW} is measured from the later of $\overline{UB}$ going low to the end of write.
