

DUAL LOW VOLTAGE POWER AMPLIFIER

■ GENERAL DESCRIPTION

The NJM2073 is a monolithic integrated circuit in 8 lead dual-in-line package, which is designed for dual audio power amplifier in portable radio and handy cassette player.

■ FEATURES

- Operating Voltage $V^+ = 1.8 \sim 15V$
- Low Crossover Distortion
- Low Operating Current
- Bridge or Stereo Configuration
- No Turn-on Noise
- Package Outline DIP8, DMP8, SIP9
- Bipolar Technology

TYPICAL APPLICATION & TEST CIRCUIT

Fig.2 Stereo Configuration

■ PARASITIC OSCILLATION PREVENTING CIRCUIT

Put $1\Omega + 0.22\mu\text{F}$ on parallel to load, if the load is speaker. Recommend putting $0.1\mu\text{F}$ and more than $100\mu\text{F}$ capacitors with good high frequency characteristics in to near ground and supply voltage pins.

In BTL operation of less than 2V supply voltage, parasitic oscillation may be occurred with $R = 1\Omega$. And so recommended R to be the same value of pure resistance(r) when it is lower than 3V.

■ MUTING CIRCUIT

When Mute ON, OUTPUT level saturates to GND side.

■ VOLTAGE GAIN REDUCTION APPLICATION EXAMPLE

(1) Outline of way to further Reduction

NJM2073 by taking in assumption, as one of OP-AMP (Gain 44dB, minus input impedance about 300Ω), to feedback from output to minus input helps to get reduction of stablized voltage Gain. Fig.5 indicates the model example.

Here is the point to be noticed that, in order to get the appropriate output Bias Voltage, it is important to keep the minus input floating as DC condition,(inserting C_X), and also that when extended too much reduction of Gain might cause Oscillation due to high band phase margin. The reduction of voltage gain is limited at around 26 dB(20 times), and when oscillation, it is necessary to attach the oscillation atopper. Please examine the C_X value accordingly to the application requirement.

Fig.5 Model of Voltage Gain Reduction

$$A_v = \frac{v_o}{v_{in}} \approx \frac{R_s + R_f}{R_s + \frac{R_s + R_f}{A_v} + \frac{R_s \times R_f}{160 \times 300 (A_v)(Z_{in})}} \quad \text{〔倍〕}$$

(2) The Application Example of Voltage Gain Reduction.(STEREO)

Fig.6 indicates the application example and Table 1 indicates the recommendable value of parts to be attached externally.

Table 1, Applying purpose and Recommended Value of Externally parts to be attached.

EXTERNAL PARTS	APPLICATION PURPOSE	RECOMMENDED VALUE	REMARKS
R_g	Plus input to be grounded by fixed DC	Under about 100k Ω	Catch the noise when much higher.
R_s	AV shall be decided with R_f	—	The co-temperature of AV becomes higher in case when R_s is higher resistance. The current from output pin to GND becomes higher, in case when R_s is lower resistance. (The current sinks in vain.) Low-band Cut off frequency (fL) is to be decided. The rise time becomes longer in case that C_x is big. fL shall be decided by C_{CUP} and Z_L .
R_f	AV shall be decided with R_s	About 5k Ω	
C_x	Minus input to be grounded by fixed DC	—	
C_{CUP}	Output DC Decoupling	When $R_L = 8\Omega$, More than 220 μ F	Inserting near around V^+ pin and GND pin.
C_{P1}	Stabilization of V^+	More than about C_{cup}	
C_{P2}	Prevention of Oscillation	More than 0.1 μ F	To be examined by about the resisitor volume of the speaker load.
r	"	About R_L	
C	"	0.22 μ F

● Application for Voltage Gain Reduction (BTL)

Fig.7 indicates the application example, Table 2 shows recommended value of externally attaching parts.

Table 2 Applying purpose and Recommended Value of External Part

EXTERNAL PARTS	APPLICATION PURPOSE	RECOMMENDED VALUE	REMARKS
R_g	DC condition ground of plus input	Below about 10k Ω	Making noise when higher.
R_s	AV shall be decided with R_f		
R_f	AV shall be decided with R_s	About 5k Ω	Temperature feature to be increased accordingly as in higher AV value.
C_1	Releasing minus input in to DC condition		When lower, to be trended of Oscillation. Setting up low band Cut-off frequency (fL). More higher, the rise time become longer.
C_2	Preventing Oscillation	About 0.02 μ F	The more higher in value, the high band THD, due to phase slipping to be deteriorated.
C_{p1}	Stability of V^+	more than about 100 μ F	When lower, to be trended of oscillation. Inserting near around at V^+ and the GND pin.
C_{p2}	Preventing Oscillation	more than 0.1 μ F	"
r	"	About R_L	To be examined at around pure resister Value of speaker load.
