3. Operation

This section describes the functions and basic operational blocks of TMP93CS32 devices.
See the 7.Points of Concern and Restriction for the using notice and restrictions for each block.

3.1 CPU

The TMP93CS32 device has a built-in high-performance 16-bit CPU (900/L CPU). (For CPU operation, see TLCS-900/L CPU in the previous section).

This section describes CPU functions unique to the TMP93CS32 that are not described in the previous section.

3.1.1 Reset

To reset the TMP93CS32, the **RESET** input must be kept at 0 for at least 10 system clocks (Resetting initializes the clock gear to 1/16 : 16 μ s at 20 MHz) within the operating voltage range and with a stable oscillation.

When reset is accepted, the CPU sets as follows:

- Program Counter (PC) according to Reset Vector that is stored FFFF00H to FFFF02H.
 - PC (7 to 0) ← data in location FFFF00H
 - PC (15 to 8) ← data in location FFFF01H
 - PC (23 to 16) ← data in location FFFF02H
- Stack pointer (XSP) for system mode to 100H.
- IFF2 to 0 bits of status register to 111. (Sets mask register to interrupt level 7.)
- MAX bit of status register to 1. (Sets to maximum mode)
- Bits RFP2 to 0 of status register to 000. (Sets register banks to 0.)

When reset is released, instruction execution starts from PC (reset vector). CPU internal registers other than the above are not changed.

When reset is accepted, processing for built-in I/Os, ports, and other pins is as follows

- Initializes built-in I/O registers as per specifications.
- Sets port pins (including pins also used as built-in I/Os) to general-purpose input / output port mode.
- Pulls up the CLK pin to “H” level.
- Sets the ALE pin to High Impeadance (High-Z).

Note 1: By resetting, register in the CPU except program counter (PC), status register (SR) and stack pointer (XSP) and the data in internal RAM are not changed.

Note 2: The CLK pin is pulled up to “H” level during reset. When the voltage is put down externally, there is possible to cause malfunctions.

Figure 3.1.1 shows the reset timing chart of TMP93CS32.

3.1.2 AM8/T $\overline{6}$ pin

Set this pin to “H”. After reset, the CPU accesses the internal ROM with 16 bit bus width. The bus width when the CPU accesses an external area is set by bus width / wait control registers and the registers of Port 1. (The value “H” of this pin is ignored and the value set by register is active.) For details, see the bus width / wait control registers in section 3.6.3.

4. Electrical Characteristics

4.1 Absolute Maximum Ratings (TMP93CS32F)

“X” used in an expression shows a cycle of clock f_{PPH} . If a clock gear or a low speed oscillator is selected, a value of “X” is different. The value as an example is gear = 1/fc (SYSCR1 < GEAR 2 to 0 > = “000”).

Parameter	Symbol	Rating	Unit
Power Supply Voltage	V _{CC}	– 0.5 to 6.5	V
Input Voltage	V _{IN}	– 0.5 to V _{CC} + 0.5	V
Output current (Per 1 pin) P7	I _{OL1}	20	mA
Output current (Per 1 pin) except P7	I _{OL2}	2	mA
Output Current (total)	Σ I _{OL}	120	mA
Output Current (total)	Σ I _{OH}	– 80	mA
Power Dissipation (Ta = 85°C)	P _D	350	mW
Soldering Temperature (10 s)	T _{SOLDER}	260	°C
Storage Temperature	T _{STG}	– 65 to 150	°C
Operating Temperature	T _{OPR}	– 40 to 85	°C

Note: The absolute maximum ratings are rated values which must not be exceeded during operation, even for an instant. Any one of the ratings must not be exceeded. If any absolute maximum rating is exceeded, a device may break down or its performance may be degraded, causing it to catch fire or explode resulting in injury to the user. Thus, when designing products which include this device, ensure that no absolute maximum rating value will ever be exceeded.
