

MM74C175

Quad D-Type Flip-Flop

General Description

The MM74C175 consists of four positive-edge triggered D-type flip-flops implemented with monolithic CMOS technology. Both true and complemented outputs from each flip-flop are externally available. All four flip-flops are controlled by a common clock and a common clear. Information at the D-type inputs meeting the set-up time requirements is transferred to the Q outputs on the positive-going edge of the clock pulse. The clearing operation, enabled by a negative pulse at Clear input, clears all four Q outputs to logical "0" and Q's to logical "1".

All inputs are protected from static discharge by diode clamps to V_{CC} and GND.

Features

- Wide supply voltage range: 3V to 15V
- Guaranteed noise margin: 1.0V
- High noise immunity: 0.45 V_{CC} (typ.)
