

LAS 1600 SERIES

2 AMP POSITIVE VOLTAGE REGULATORS

FEATURES

- Guaranteed Power Dissipation 20 Watts @ 75°C Case
- Guaranteed input-output differential: + 2.6 Volts
- Low noise, band gap reference
- Remote sense capability
- Sample power cycled burn-in
- Guaranteed thermal resistance junction to case: 2.5°C/W

DESCRIPTION

The LAS 1600 Series voltage regulators are monolithic integrated circuits designed for use in applications requiring a well regulated positive output voltage. Outstanding features include full power usage up to 2.0 amperes of load current, internal current limiting, thermal shutdown, and safe area protection on the chip, providing protection of the series pass Darlington, under most operating conditions. Hermetically sealed steel TO-3 packages are utilized for high reliability and low thermal resistance. A low-noise, temperature stable band gap reference is the key design factor insuring excellent temperature regulation of the LAS 1600 Series. This, coupled to a very low output impedance, insures superior load regulation.

The LAS 16U, a four terminal, adjustable regulator is available with an output range from +4 to +30 Volts, providing remote sense capability with a single potentiometer.

ABSOLUTE MAXIMUM RATINGS

PARAMETER	SYMBOL	MINIMUM	MAXIMUM	UNITS
Input Voltage	V_{IN}		35 (40) ⁽¹⁾ (2)	Volts
Power Dissipation	P_D		Internally Limited ⁽³⁾	
Thermal Resistance Junction To Case	θ_{JC}		2.5	°C/Watt
Operating Junction Temperature Range	T_J	-55	150	°C
Storage Temperature Range	T_{STG}	-65	150	°C
Lead Temperature (Soldering, 60 Seconds Time Limit)	T_{LEAD}		300	°C

⁽¹⁾ Short circuit protection is only assured to V_{IN} max. Value of 35V applies to V_O of +5V to +12V. Value of 40V applies to V_O of 13.8V and 15V, and LAS 16U.

⁽²⁾ In case of short circuit, with input-output voltages approaching V_{IN} max, regulator may require the removal of the input voltage to restart.

⁽³⁾ For operation above 75°C T_{CASE} , derate @ 0.4 W/°C.

ELECTRICAL CHARACTERISTICS

Input voltage test conditions are as follows: $V_1 = V_0 + 3$ Volts, $V_2 = V_0 + 10$ Volts, $V_3 = V_0 + 15$ Volts, or the maximum input, whichever is less.

(1) Nominal output voltages are specified under Device Selection Guide.

(2) Low duty cycle pulse testing with Kelvin connections required. Die temperature changes must be accounted for separately.

(3) BW = 10Hz - 100KHz

(4) Ripple attenuation is specified for a 1Vrms, 120Hz, input ripple.

Ripple attenuation is minimum of 60 dB at 5V output and is 1 dB less for each volt increase in the output voltage.

(5) $V_O = V_C (1 + R1/R2)$

R1 = Resistance from output to control

R2 = Resistance from control to common
