## 2K-bit TTL bipolar PROM

### DESCRIPTION

The 82S130 and 82S131 are field programmable, which means that custom patterns are immediately available by following the Signetics Generic I fusing procedure. The 82S130 and 82S131 devices are supplied with all outputs at logical Low. Outputs are programmed to a logic High level at any specified address by fusing the Ni-Cr link matrix.

These devices include on-chip decoding and 1 Chip Enable input for ease of memory expansion. They feature either Open Collector or 3-State outputs for optimization of word expansion in bused organizations.

Ordering information can be found on the following page.

The 82S130 and 82S131 devices are also processed to military requirements for operation over the military temperature range. For specifications and ordering information, consult the Signetics Military Data Handbook.
