Remark
Preliminary

# 256K X 36 Bit Synchronous High Speed SRAM with Burst Counter and Pipelined Data Output 

## Preliminary

## Features

■ Fast access times: 2.6/2.8/3.2/3.5/3.8/4.2 ns (250/227/200/166/150/133 MHz)
■ Single $+2.5 \mathrm{~V}+10 \%$ or $+2.5 \mathrm{~V}-5 \%$ power supply

- Synchronous burst function
- Individual Byte Write control and Global Write

■ Registered output for pipelined applications

## General Description

The A63P8336 is a high-speed SRAM containing 9M bits of bit synchronous memory, organized as 256 K words by 36 bits.
The A63P8336 combines advanced synchronous peripheral circuitry, 2-bit burst control, input registers, output registers and a 256 KX 36 SRAM core to provide a wide range of data RAM applications.
The positive edge triggered single clock input (CLK) controls all synchronous inputs passing through the registers. Synchronous inputs include all addresses (A0 A17), all data inputs (I/O1-I/O36), active LOW chip enable ( $\overline{\mathrm{CE}}$ ), two additional chip enables (CE2, $\overline{\mathrm{CE} 2}$ ), burst control inputs ( $\overline{\text { ADSC }}, \overline{\text { ADSP }}, \overline{\text { ADV }}$ ), byte write enables ( $\overline{\mathrm{BWE}}, \overline{\mathrm{BW} 1}, \overline{\mathrm{BW} 2}, \overline{\mathrm{BW} 3}, \overline{\mathrm{BW} 4}$ ) and Global Write ( $\overline{\mathrm{GW}}$ ). Asynchronous inputs include output enable ( $\overline{\mathrm{OE}}$ ), clock (CLK), BURST mode (MODE) and SLEEP mode (ZZ).

■ Three separate chip enables allow wide range of options for CE control, address pipelining
■ Selectable BURST mode
■ SLEEP mode (ZZ pin) provided

- Available in 100-pin LQFP package

Burst operations can be initiated with either the address status processor ( $\overline{\mathrm{ADSP}}$ ) or address status controller ( $\overline{\text { ADSC }}$ ) input pin. Subsequent burst sequence burst addresses can be internally generated by the A63P8336 and controlled by the burst advance ( $\overline{\mathrm{ADV}}$ ) pin. Write cycles are internally self-timed and synchronous with the rising edge of the clock (CLK).
This feature simplifies the write interface. Individual Byte enables allow individual bytes to be written. $\overline{\mathrm{BW1}}$ controls I/O1 - I/O9, $\overline{\mathrm{BW} 2}$ controls $\mathrm{I} / \mathrm{O}_{10}-\mathrm{I} / \mathrm{O}_{18}, \overline{\mathrm{BW} 3}$ controls $\mathrm{I} / \mathrm{O}_{19}-\mathrm{I} / \mathrm{O}_{27}$, and $\overline{\mathrm{BW} 4}$ controls $\mathrm{I} / \mathrm{O}_{28}-\mathrm{I} / \mathrm{O}_{36}$, all on the condition that $\overline{\mathrm{BWE}}$ is LOW. $\overline{\mathrm{GW}}$ LOW causes all bytes to be written.

AMIC

Notes：1． $\mathrm{X}=$＂Disregard＂，H＝Logic High，L＝Logic Low．
2．$\overline{\text { WRITE }}=\mathrm{L}$ means：
1）Any $\overline{\mathrm{BWX}}(\overline{\mathrm{BW} 1}, \overline{\mathrm{BW} 2}, \overline{\mathrm{BW} 3}$ ，or $\overline{\mathrm{BW} 4})$ and $\overline{\mathrm{BWE}}$ are low or
2）$\overline{\mathrm{GW}}$ is low．
3．All inputs except $\overline{\mathrm{OE}}$ must be synchronized with setup and hold times around the rising edge（L－H）of CLK．
4．For write cycles that follow read cycles，$\overline{\mathrm{OE}}$ must be HIGH before the input data request setup time and held HIGH throughout the input data hold time．
5．$\overline{\mathrm{ADSP}}$ LOW always initiates an internal Read at the L－H edge of CLK．A Write is performed by setting one or more byte write enable signals and BWE LOW or $\overline{\mathrm{GW}}$ LOW for the subsequent L－H edge of CLK．Refer to the Write timing diagram for clarification．

## Write Truth Table

| Operation | $\overline{\text { GW }}$ | $\overline{\text { BWE }}$ | $\overline{\text { BW1 }}$ | $\overline{\text { BW2 }}$ | $\overline{\text { BW3 }}$ | $\overline{\text { BW4 }}$ |

## *Comments

Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to this device. These are stress ratings only. Functional operation of this device at these or any other conditions above those indicated in the operational sections of this specification is not implied or intended. Exposure to the absolute maximum rating conditions for extended periods may affect device reliability.

## Recommended DC Operating Conditions

Notes:

1. All voltages refer to GND.
2. Overshoot: $\mathrm{V}_{\mathrm{IH}} \leq+4.6 \mathrm{~V}$ for $\mathrm{t} \leq \mathrm{tkc} / 2$.

Undershoot: $\mathrm{V}_{\mathrm{HH}} \geq-0.7 \mathrm{~V}$ for $\mathrm{t} \leq \mathrm{tkc} / 2$.
Power-up: $\quad \mathrm{V}_{\mathrm{IH}} \leq+3.6$ and $\mathrm{VCC} \leq 3.1 \mathrm{~V}$ for $\mathrm{t} \leq 200 \mathrm{~ms}$
3. Icc is given with no output current. Icc increases with greater output loading and faster cycle times.
4. Test conditions assume the output loading shown in Figure 1, unless otherwise specified.
5. For output loading, $C_{L}=5 \mathrm{pF}$, as shown in Figure 2. Transition is measured $\pm 150 \mathrm{mV}$ from steady state voltage.
6. At any given temperature and voltage condition, tкфнz is less than tкфlz and toenz is less than teelz.
7. A WRITE cycle is defined by at least one Byte Write enable LOW and $\overline{\text { ADSP }}$ HIGH for the required setup and hold times. A READ cycle is defined by all byte write enables HIGH and ( $\overline{\text { ADSC }}$ or $\overline{\text { ADV }}$ LOW) or $\overline{\text { ADSP }}$ LOW for the required setup and hold times.
8. $\overline{\mathrm{OE}}$ has no effect when a Byte Write enable is sampled LOW.
9. This is a synchronous device. All addresses must meet the specified setup and hold times for all rising edges of CLK when either $\overline{\text { ADSP }}$ or $\overline{\text { ADSC }}$ is LOW and the chip is enabled. All other synchronous inputs must meet the setup and hold times with stable logic levels for all rising edges of clock (CLK) when the chip is enabled. Chip enable must be valid at each rising edge of CLK when either $\overline{\text { ADSP }}$ or $\overline{\text { ADSC }}$ is LOW to remain enabled.
10. The load used for Voн, Vol testing is shown in Figure 2. AC load current is higher than the given DC values.

AC I/O curves are available upon request.
11. "Device Deselected" means device is in POWER-DOWN mode, as defined in the truth table. "Device Selected" means device is active (not in POWER-DOWN mode).
12. MODE pin has an internal pulled-up, and $Z Z$ pin has an internal pulled-down. All of then exhibit an input leakage current of $10 \mu \mathrm{~A}$.
13. Snooze (ZZ) input is recommended that users plan for four clock cycles to go into SLEEP mode and four clocks to emerge from SLEEP mode to ensure no data is lost.

## Timing Waveforms

## Read Timing

Notes:
*1. $\mathrm{Q}(\mathrm{A} 2)$ refers to output from address $\mathrm{A} 2 . \mathrm{Q}(\mathrm{A} 2+1)$ refers to output from the internal burst address immediately following A2.
*2. Timing for $\overline{\mathrm{CE} 2}$ and CE2 is identical to that for $\overline{\mathrm{CE}}$. As shown in this diagram, when $\overline{\mathrm{CE}}$ is LOW, $\overline{\mathrm{CE} 2}$ is LOW and CE2 is HIGH. When $\overline{\mathrm{CE}}$ is HIGH, $\overline{\mathrm{CE} 2}$ is HIGH and CE2 is LOW.
*3. Timing shown assumes that the device was not enabled before entering this sequence. $\overline{\mathrm{OE}}$ does not cause Q to be driven until after the rising edge of the following clock.

## Timing Waveforms (continued)

## Write Timing

Notes: *1. $\mathrm{D}(\mathrm{A} 2)$ refers to output from address $\mathrm{A} 2 . \mathrm{D}(\mathrm{A} 2+1)$ refers to output from the internal burst address immediately following A2.
*2. Timing for $\overline{\mathrm{CE} 2}$ and CE2 is identical to that for $\overline{\mathrm{CE}}$. As shown in the above diagram, when $\overline{\mathrm{CE}}$ is LOW, $\overline{\mathrm{CE} 2}$ is LOW and CE2 is HIGH. When $\overline{\mathrm{CE}}$ is HIGH, $\overline{\mathrm{CE} 2}$ is HIGH and CE2 is LOW.
*3. $\overline{\mathrm{OE}}$ must be HIGH before the input data setup, and held HIGH throughout the data hold period. This prevents input/output data contention for the period prior to the time Byte Write enable inputs are sampled.
*4. $\overline{\text { ADV }}$ must be HIGH to permit a Write to the loaded address.
*5. Byte Write enables are decided by means of a Write truth table.

## Timing Waveforms (continued)

## Read/Write Timing

Notes:
*1. $\mathrm{Q}(\mathrm{A} 4)$ refers to output from address A4. $\mathrm{Q}(\mathrm{A} 4+1)$ refers to output from the internal burst address immediately following A4.
*2. Timing for $\overline{\mathrm{CE} 2}$ and CE2 is identical to that for $\overline{\mathrm{CE}}$. As shown in this diagram, when $\overline{\mathrm{CE}}$ is LOW, $\overline{\mathrm{CE} 2}$ is LOW and CE2 is HIGH. When $\overline{\mathrm{CE}}$ is HIGH, $\overline{\mathrm{CE} 2}$ is HIGH and CE 2 is LOW.
*3. Byte Write enables are decided by means of a Write truth table.
*4. Pass-through occurs when data is first written, then Read in sequence.

## AC Test Conditions

| Input Pulse Levels | GND to 3V |
| :--- | :---: |
| Input Rise and Fall Times | 1.5 ns |
| Input Timing Reference Levels | 1.5 V |
| Output Reference Levels | 1.5 V |
| Output Load | See Figures 1 and 2 |

Figure 1. Output Load Equivalent

Figure 2. Output Load Equivalent

A63P8336

## Ordering Information

| Part No. | Access Times (ns) | Frequency (MHz) | Package |
| :---: | :---: | :---: | :---: |
| A63P8336E-2.6 | 2.6 | 250 | 100L LQFP |
| A63P8336E-2.6F | 2.6 | 250 | 100 Pb -Free LQFP |
| A63P8336E-2.8 | 2.8 | 225 | 100L LQFP |
| A63P8336E-2.8F | 2.8 | 225 | 100L Pb-Free LQFP |
| A63P8336E-3.2 | 3.2 | 200 | 100L LQFP |
| A63P8336E-3.2F | 3.2 | 200 | 100L Pb-Free LQFP |
| A63P8336E-3.5 | 3.5 | 166 | 100L LQFP |
| A63P8336E-3.5F | 3.5 | 166 | 100L Pb-Free LQFP |
| A63P8336E-3.8 | 3.8 | 150 | 100L LQFP |
| A63P8336E-3.8F | 3.8 | 150 | 100L Pb-Free LQFP |
| A63P8336E-4.2 | 4.2 | 133 | 100L LQFP |
| A63P8336E-4.2F | 4.2 | 133 | 100L Pb-Free LQFP |

## Package Information

| Symbol | Dimensions in inches |  |  | Dimensions in mm |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Min. | Nom. | Max. | Min. | Nom. | Max. |
| A1 | 0.002 | - | - | 0.05 | - | - |
| A2 | 0.053 | 0.055 | 0.057 | 1.35 | 1.40 | 1.45 |
| b | 0.011 | 0.013 | 0.015 | 0.27 | 0.32 | 0.37 |
| c | 0.005 | - | 0.008 | 0.12 | - | 0.20 |
| He | 0.860 | 0.866 | 0.872 | 21.85 | 22.00 | 22.15 |
| E | 0.783 | 0.787 | 0.791 | 19.90 | 20.00 | 20.10 |
| HD | 0.624 | 0.630 | 0.636 | 15.85 | 16.00 | 16.15 |
| D | 0.547 | 0.551 | 0.555 | 13.90 | 14.00 | 14.10 |
| - | 0.026 BSC |  |  | 0.65 BSC |  |  |
| L | 0.018 | 0.024 | 0.030 | 0.45 | 0.60 | 0.75 |
| L1 | 0.039 REF |  |  | 1.00 REF |  |  |
| y | - | - | 0.004 | - | - | 0.1 |
| $\theta$ | $0^{\circ}$ | $3.5{ }^{\circ}$ | $7^{\circ}$ | $0^{\circ}$ | $3.5{ }^{\circ}$ | $7^{\circ}$ |

## Notes:

1. Dimensions D and E do not include mold protrusion.
2. Dimensions $b$ does not include dambar protrusion.

Total in excess of the $b$ dimension at maximum material condition. Dambar cannot be located on the lower radius of the foot.
