

May 2006

Features

- Single 5 volt supply
- Programmable μ -law/A-law Codec and filters
- Fully differential output driver
- SSI digital interface
- SSI speed control via external pins CSLO-CSL2
- Individual transmit and receive mute controls
- 0 dB gain in receive path
- 6 dB gain in transmit path
- Low power operation
- ITU-T G.714 compliant

Applications

- Cellular radio sets
- Local area communications stations
- Line cards

Ordering Information

Description

The MT9162 5 V single rail Codec incorporates a built-in Filter/Codec, transmit anti-alias filter, a reference voltage and bias source. The device supports both A-law and μ -law requirements.

The analog interface is capable of driving a 20 k ohm load.

The MT9162 is fabricated in Zarlink's ISO²-CMOS technology ensuring low power consumption and high reliability.

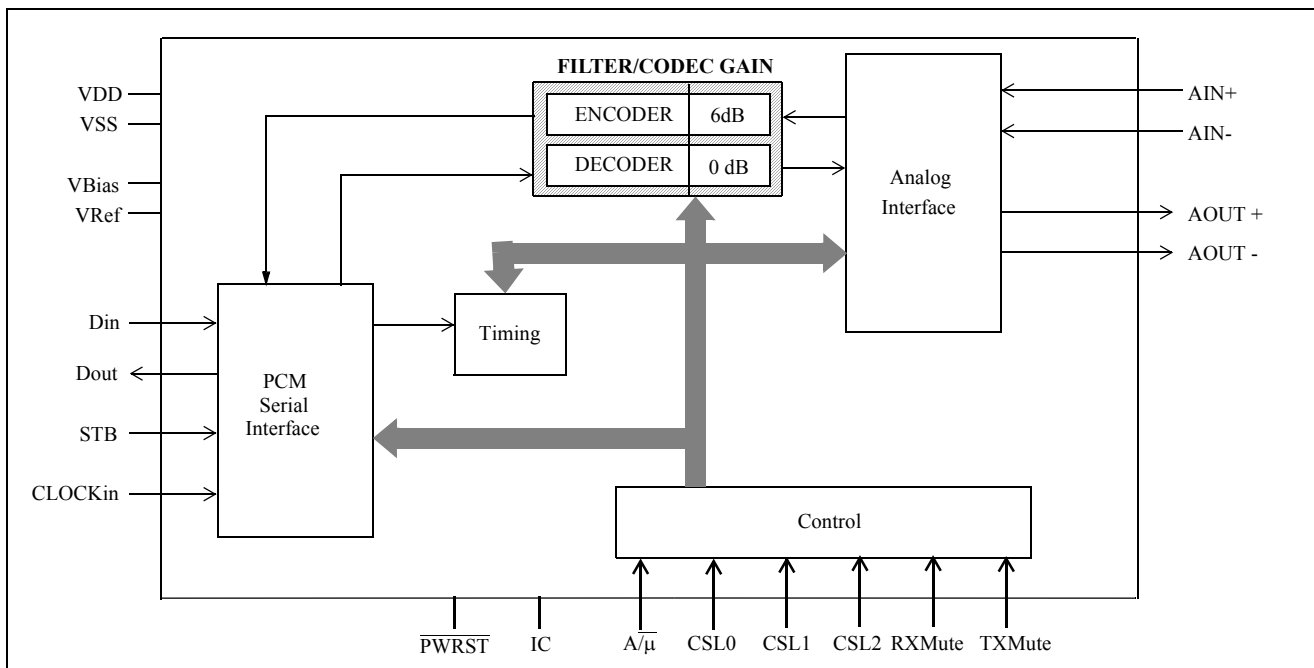

Figure 1 - Functional Block Diagram

Figure 2 - Pin Connections

Pin Description

Pin #	Name	Description
1	V _{Bias}	Bias Voltage (Output). ($V_{DD}/2$) volts is available at this pin for biasing external amplifiers. Connect 0.1 μ F capacitor to V _{SS} . Connect 1 μ F capacitor to Vref.
2	V _{Ref}	Reference Voltage for Codec (Output). Nominally $[(V_{DD}/2)-1.9]$ volts. Used internally. Connect 0.1 μ F capacitor to V _{SS} . Connect 1 μ F capacitor to VBias
3	PWRST	Power-up Reset. Resets internal state of device via Schmitt Trigger input (active low).
4	IC	Internal Connection. Tie externally to V _{SS} for normal operation.
5	A/ $\bar{\mu}$	A/$\bar{\mu}$ Law Selection. CMOS level compatible input pin governs the companding law used by the device. A-law selected when pin tied to V _{DD} or μ -law selected when pin tied to V _{SS} .
6	RXMute	Receive Mute. When 1, the transmit PCM is forced to negative zero code. When 0, normal operation. CMOS level compatible.
7	TXMute	Transmit Mute. When 1, the transmit PCM is forced to negative zero code. When 0, normal operation. CMOS level compatible.
8 9 10	CSL0 CSL1 CSL2	Clock Speed Select. These pins are used to program the speed of the SSI mode as well as the conversion rate between the externally supplied MCL clock and the 512 kHz clock required by the filter/codec. Refer to Table 2 for details. CMOS level compatible.
11	D _{out}	Data Output. A tri-state digital output for 8-bit wide channel data being sent to the Layer 1 device. Data is shifted out via the pin concurrent with the rising edge of BCL during the timeslot defined by STB.
12	D _{in}	Data Input. A digital input for 8-bit wide data from the layer 1 device. Data is sampled on the falling edge of BCL during the timeslot defined by STB. CMOS level compatible.
13	STB	Data Strobe. This input determines the 8-bit timeslot used by the device for both transmit and receive data. This active high signal has a repetition rate of 8 kHz. CMOS level compatible.
14	CLOCKin	Clock (Input). The clock provided to this input pin is used by the internal device functions. Connect bit clock to this pin when it is 512 kHz or greater. Connect a 4096 kHz clock to this pin when the bit clock is 128 kHz or 256 kHz. CMOS level compatible.
15	V _{DD}	Positive Power Supply. Nominally 5 volts.

Pin Description (continued)

Pin #	Name	Description
16	AOUT-	Inverting Analog Output. (balanced).
17	AOUT+	Non-Inverting Analog Output. (balanced).
18	V _{SS}	Ground. Nominally 0 volts.
19	Ain-	Inverting Analog Input. No external anti-aliasing is required.
20	Ain+	Non-Inverting Analog Input. Non-inverting input. No external anti-aliasing is required.

Overview

The 5 V single rail Codec features complete Analog/Digital and Digital/Analog conversion of audio signals (Filter/Codec) and an analog interface to a standard analog transmitter and receiver (Analog Interface). The receiver amplifier is capable of driving a 20 k ohm load.

Functional Description**Filter/Codec**

The Filter/Codec block implements conversion of the analog 0-3.3 kHz speech signals to/from the digital domain compatible with 64 kb/s PCM B-Channels. Selection of companding curves and digital code assignment are programmable. These are ITU-T G.711 A-law or μ -Law, with true-sign/Alternate Digit Inversion.

The Filter/Codec block also implements a transmit audio path gain in the analog domain. Figure 3 depicts the nominal half-channel for the MT9162.

The internal architecture is fully differential to provide the best possible noise rejection as well as to allow a wide dynamic range from a single 5 volt supply design. This fully differential architecture is continued into the analog interface section to provide full chip realization of these capabilities for the external functions.

A reference voltage (V_{Ref}), for the conversion requirements of the Codec section, and a bias voltage (V_{Bias}), for biasing the internal analog sections, are both generated on-chip. V_{Bias} is also brought to an external pin so that it may be used for biasing external gain setting amplifiers. A 0.1 μ F capacitor must be connected from V_{Bias} to analog ground at all times. Likewise, although V_{Ref} may only be used internally, a 0.1 μ F capacitor from the V_{Ref} pin to ground is required at all times. The analog ground reference point for these two capacitors must be physically the same point. To facilitate this the V_{Ref} and V_{Bias} pins are situated on adjacent pins.

The transmit filter is designed to meet ITU-T G.714 specifications. An anti-aliasing filter is included. This is a second order lowpass implementation with a corner frequency at 25 kHz.

The receive filter is designed to meet ITU-T G.714 specifications. Filter response is peaked to compensate for the $\sin x/x$ attenuation caused by the 8 kHz sampling rate.

Companding law selection for the Filter/Codec is provided by the A/ $\bar{\mu}$ companding control pin. Table 1 illustrates these choices.

Code	ITU-T (G.711)	
	μ -Law	A-Law
+ Full Scale	1000 0000	1010 1010
+ Zero	1111 1111	1101 0101
-Zero (quiet code)	0111 1111	0101 0101
- Full Scale	0000 0000	0010 1010

Table 1 - Law Selection

Analog Interfaces

Standard interfaces are provided by the MT9162. These are:

- The analog inputs (transmitter), pins AIN+/AIN-. The maximum peak to peak input is 3.667Vpp μ -law and across AIN+/AIN- 3.8Vpp A-law.
- The analog outputs (receiver), pins AOUT+/AOUT-. This internally compensated fully differential output driver is capable of driving a load of 20k ohms.

PCM Serial Interface

A serial link is required to transport data between the MT9162 and an external digital transmission device. The MT9162 utilizes the strobed data interface found on many standard Codec devices. This interface is commonly referred to as Simple Serial Interface (SSI).

The required mode of operation is selected via the CSL2-0 control pins. See Table 2 for selections based in CSL2-0 pin settings.

Quiet Code

The PCM serial port can be made to send quiet code to the decoder and receive filter path by setting the RxMute pin high. Likewise, the PCM serial port will send quiet code in the transmit path when the

CSL ₂	CSL ₁	CSL ₀	External Clock Bit Rate (kHz)	CLOCKin (kHz)
1	0	0	128	4096
1	0	1	256	4096
0	0	0	512	512
0	0	1	1536	1536
0	1	0	2048	2048
0	1	1	4096	4096

Figure 2 - Table 2: Bit Clock Rate Selection

TxMute pin is high. When either of these pins are low their respective paths function normally. The -Zero entry of Table 1 is used for the quiet code definition.

SSI Mode

The SSI BUS consists of input and output serial data streams named Din and Dout respectively, a Clock input signal (CLOCKin), and a framing strobe input (STB). A 4.096 MHz master clock is also required for SSI operation if the bit clock is less than 512 kHz. The timing requirements for SSI are shown in Figures 5 & 6.

In SSI mode the MT9162 supports only B-Channel operation. Hence, in SSI mode transmit and receive B-Channel data are always in the channel defined by the STB input.

The data strobe input STB determines the 8-bit timeslot used by the device for both transmit and receive data. This is an active high signal with an 8 kHz repetition rate.

SSI operation is separated into two categories based upon the data rate of the available bit clock. If the bit clock is 512 kHz or greater then it is used directly by the internal MT9162 functions allowing synchronous operation. If the available bit clock is 128 kHz or 256 kHz, then a 4096 kHz master clock is required to derive clocks for the internal MT9162 functions.

Applications where Bit Clock (BCL) is below 512 kHz are designated as asynchronous. The MT9162 will re-align its internal clocks to allow operation when the external master and bit clocks are asynchronous. Control pins CSL2, CSL1 and CSL0 are used to program the bit rates.

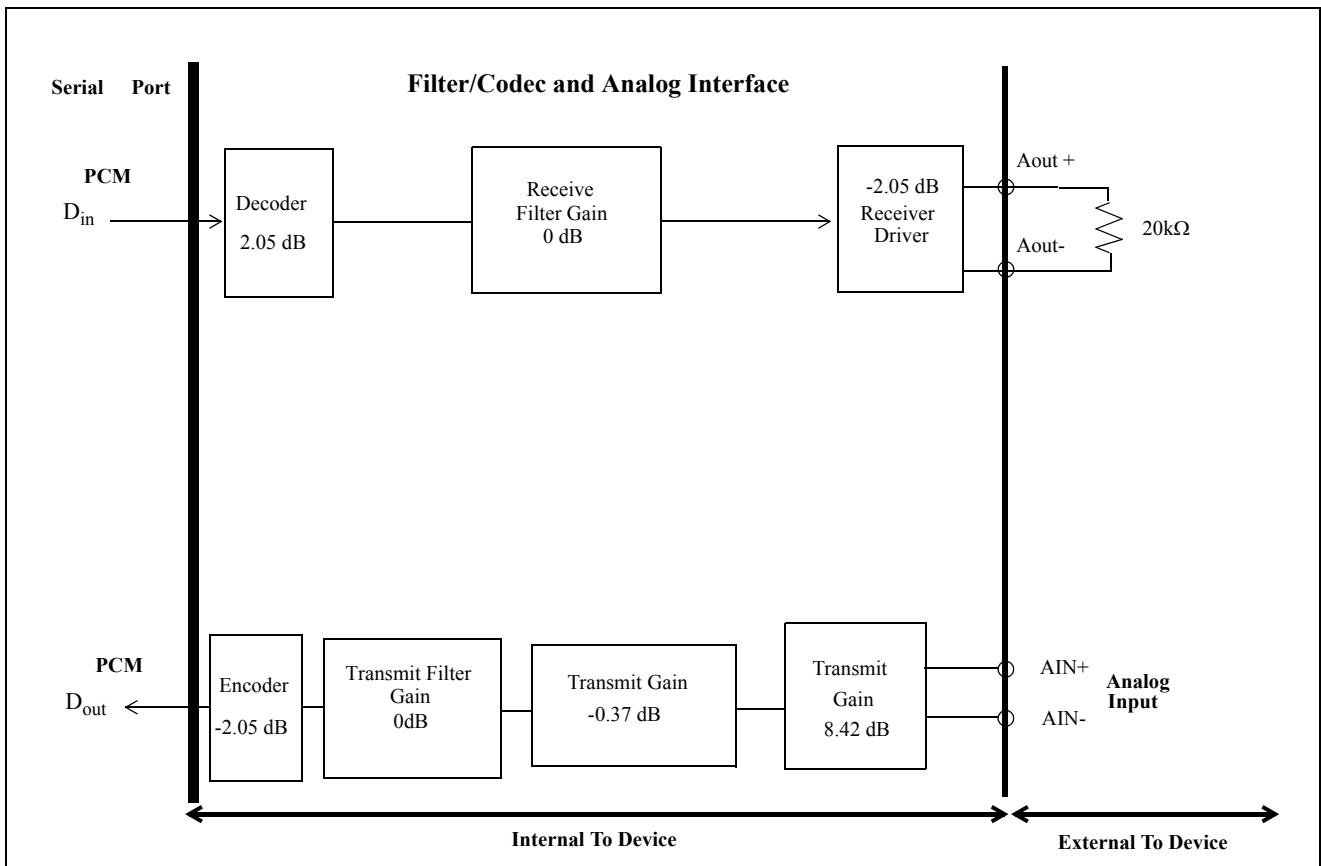

Figure 3 - Audio Gain Partitioning

For synchronous operation, data is sampled from Din, on the falling edge of BCL during the time slot defined by the STB input. Data is made available, on Dout, on the rising edge of BCL during the time slot defined by the STB input. Dout is tri-stated at all times when STB is not true. If STB is valid, then quiet code will be transmitted on Dout during the valid strobe period. There is no frame delay through the PCM serial circuit for synchronous operation.

For asynchronous operation Dout and Din are as defined for synchronous operation except that the allowed output jitter on Dout is larger. This is due to the resynchronization circuitry activity and will not affect operation since the bit cell period at 128 kb/s and 256 kb/s is relatively large. There is a one frame delay through the PCM serial circuit for asynchronous operation. Refer to the specifications of Figures 5 & 6 for both synchronous and asynchronous SSI timing.

PWRST

While the MT9162 is held in $\overline{\text{PWRST}}$ no device control or functionality is possible.

Applications

Figure 4 shows the MT9162 in a line card application.

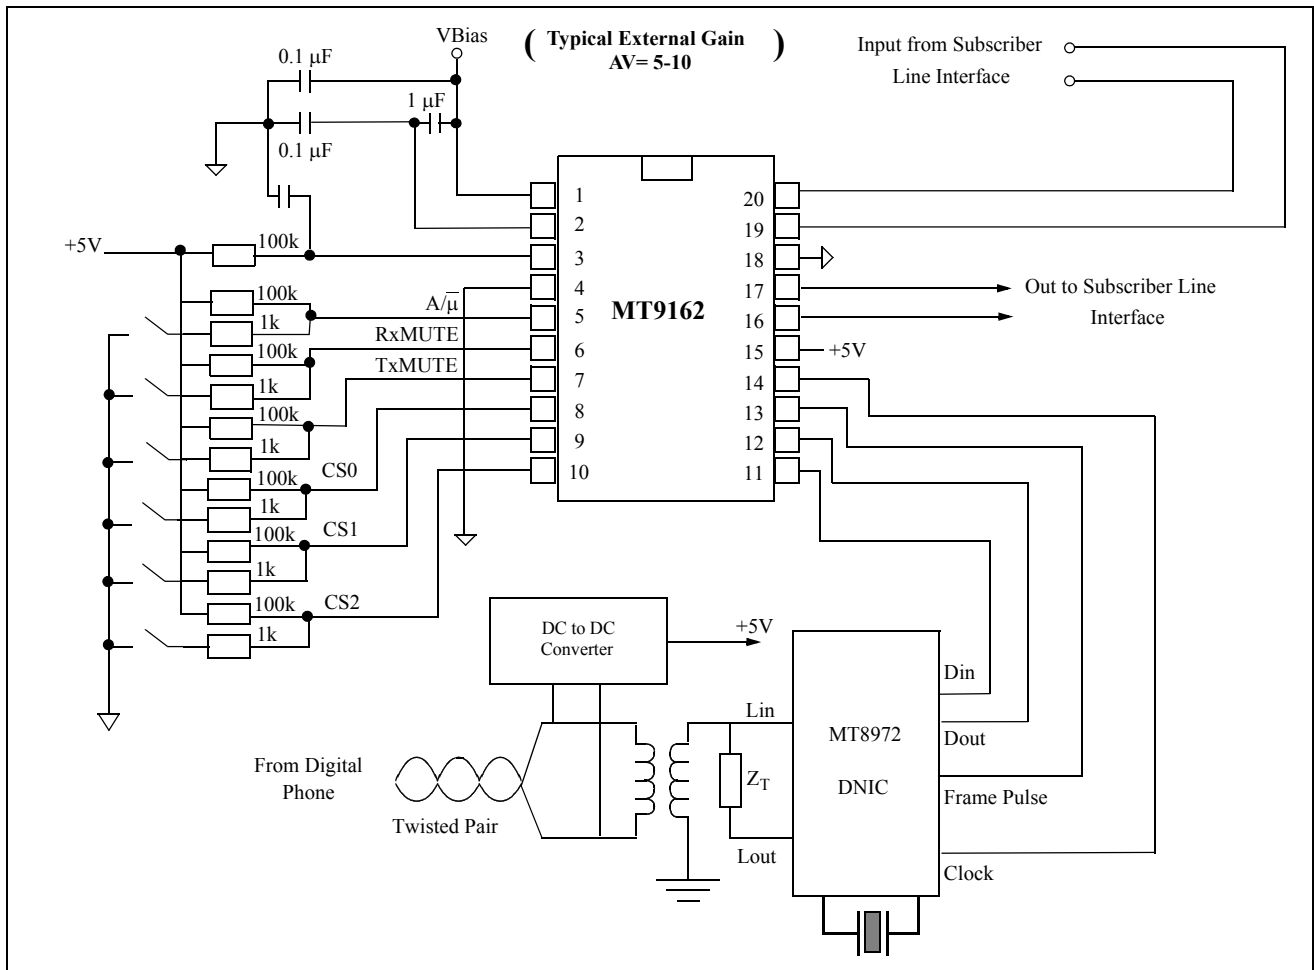

Figure 4 - Line Card Application

Absolute Maximum Ratings[†]

	Parameter	Symbol	Min.	Max.	Units
1	Supply Voltage	$V_{DD} - V_{SS}$	- 0.3	7	V
2	Voltage on any I/O pin	V_I/V_O	$V_{SS} - 0.3$	$V_{DD} + 0.3$	V
3	Current on any I/O pin (transducers excluded)	I_I/I_O		± 20	mA
4	Storage Temperature	T_S	- 65	+ 150	°C
5	Power Dissipation (package)	P_D		750	mW

[†] Exceeding these values may cause permanent damage. Functional operation under these conditions is not implied.

Recommended Operating Conditions - Voltages are with respect to V_{SS} unless otherwise stated

	Characteristics	Sym.	Min.	Typ.	Max.	Units	Test Conditions
1	Supply Voltage	V_{DD}	4.75	5	5.25	V	
2	CMOS Input Voltage (high)	V_{IHC}	4.5		V_{DD}	V	
3	CMOS Input Voltage (low)	V_{ILC}	V_{SS}		0.5	V	
4	Operating Temperature	T_A	- 40		+ 85	°C	

Power Characteristics

	Characteristics	Sym.	Min.	Typ.	Max.	Units	Test Conditions

Conforms to JEDEC MO-150 AE Iss. B						

This drawing supersedes: -
418/ED/51481/002 (Swindon/Plymouth)

Notes:

1. A visual index feature, e.g. a dot, must be located within the cross-hatched area.
2. Controlling dimension are in millimeters.
3. Dimensions D and E1 do not include mould flash or protusion. Mould flash or protusion shall not exceed 0.20 mm per side. D and E1 are maximum plastic body size dimensions including mould mismatch.
4. Dimension b does not include dambar protusion/intrusion. Allowable dambar protusion shall be 0.13 mm total in excess of b dimension. Dambar intrusion shall not reduce dimension b by more than 0.07 mm.

Conforms to JEDEC MS-013AC Iss. C						

Notes:

1. The chamfer on the body is optional. If it not present, a visual index feature, e.g. a dot, must be located within the cross-hatched area.
2. Controlling dimension are in millimeters.
3. Dimension D do not include mould flash, protrusion or gate burrs. These shall not exceed 0.006" per side.
4. Dimension E1 do not include inter-lead flash or protrusion. These shall not exceed 0.010" per side.
5. Dimension b does not include dambar protrusion/intrusion. Allowable dambar protrusion shall be 0.004" total in excess of b dimension.

Conforms to Jeduc MS-001AD Issue D				

Notes:

1. Dimensions D, D1 & E1 do not include mould flash or protrusions.
2. Dimensions E & eA are measured with leads constrained to be perpendicular to datum $\boxed{- C -}$
3. Dimensions eB & eC are measured with the leads unconstrained
4. Controlling dimensions are Inches. Millimeter conversions are not necessarily exact.
5. N is the maximum of terminal positions.
