Description

The R1LP0408C-C is a 4-Mbit static RAM organized 512-kword × 8-bit. R1LP0408C-C Series has realized higher density, higher performance and low power consumption by employing CMOS process technology (6-transistor memory cell). The R1LP0408C-C Series offers low power standby power dissipation; therefore, it is suitable for battery backup systems. It has packaged in 32-pin SOP, 32-pin TSOP II.

Features

- Single 5 V supply: 5 V ± 10%
- Access time: 55/70 ns (max)
- Power dissipation:
 - Active: 10 mW/MHz (typ)
 - Standby: 4 μW (typ)
- Completely static memory.
 - No clock or timing strobe required
- Equal access and cycle times
- Common data input and output.
 - Three state output
- Directly TTL compatible.
 - All inputs and outputs
- Battery backup operation.
- Operating temperature: -20 to +70°C

Pin Arrangement

Pin Description

Pin name	Function
A0 to A18	Address input
I/O0 to I/O7	Data input/output
CS# (CS)	Chip select
OE# (OE)	Output enable
WE# (WE)	Write enable
Vcc	Power supply
Vss	Ground

Output disable to output in high-Z	t_{OHZ}	0	20	0	25	ns	1, 2, 7

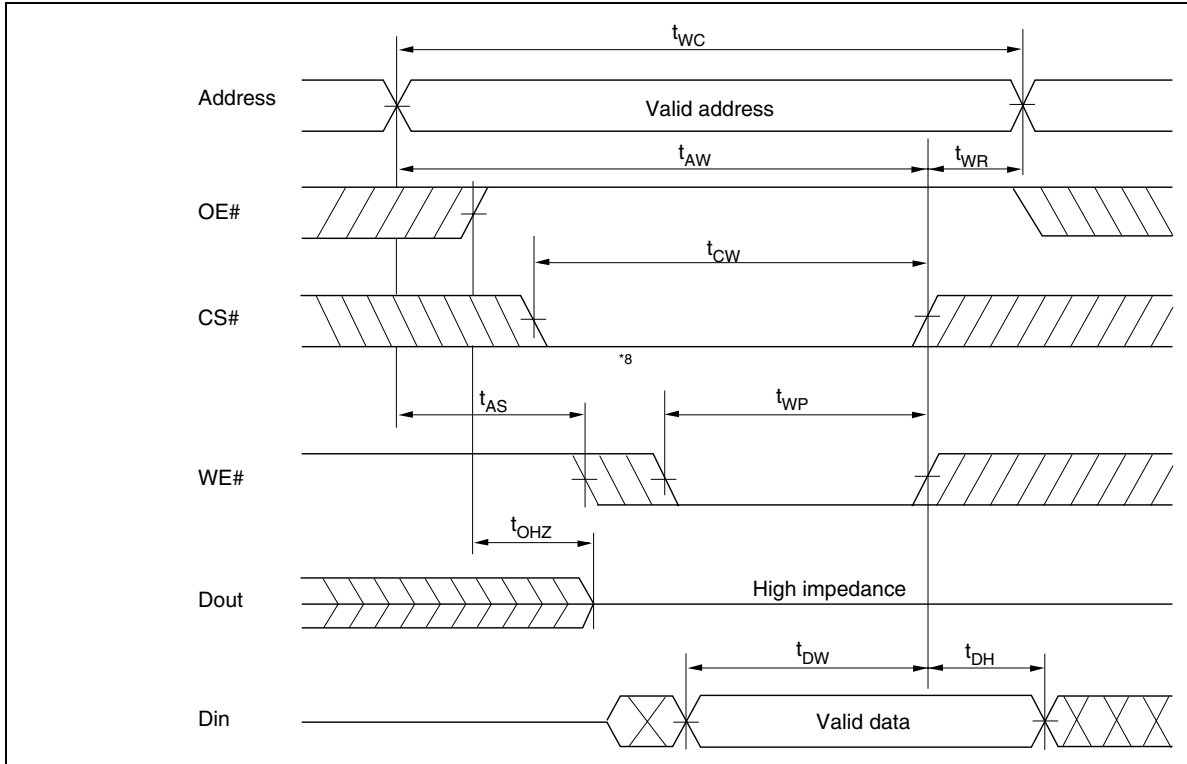

- Notes:
- t_{HZ} , t_{OHZ} and t_{WHZ} are defined as the time at which the outputs achieve the open circuit conditions and are not referred to output voltage levels.
 - This parameter is sampled and not 100% tested.
 - A write occurs during the overlap (t_{WP}) of a low CS# and a low WE#. A write begins at the later transition of CS# going low or WE# going low. A write ends at the earlier transition of CS# going high or WE# going high. t_{WP} is measured from the beginning of write to the end of write.
 - t_{CW} is measured from CS# going low to the end of write.
 - t_{AS} is measured from the address valid to the beginning of write.
 - t_{WR} is measured from the earlier of WE# or CS# going high to the end of write cycle.
 - During this period, I/O pins are in the output state so that the input signals of the opposite phase to the outputs must not be applied.
 - If the CS# low transition occurs simultaneously with the WE# low transition or after the WE# transition, the output remain in a high impedance state.
 - Dout is the same phase of the write data of this write cycle.
 - Dout is the read data of next address.
 - If CS# is low during this period, I/O pins are in the output state. Therefore, the input signals of the opposite phase to the outputs must not be applied to them.
 - In the write cycle with OE# low fixed, t_{WP} must satisfy the following equation to avoid a problem of data bus contention. $t_{WP} \geq t_{DW} \text{ min} + t_{WHZ} \text{ max}$

		to $+25^\circ\text{C}$	I_{CCDR}	—	0.8^{*1}	10	μA	
Chip deselect to data retention time		t_{CDR}	0	—	—	ns	See retention waveform	
Operation recovery time		t_R	t_{RC}^{*4}	—	—	ns		

- Notes:
1. Typical values are at $V_{CC} = 3.0\text{ V}$, $T_a = +25^\circ\text{C}$ and specified loading, and not guaranteed.
 2. Typical values are at $V_{CC} = 3.0\text{ V}$, $T_a = +40^\circ\text{C}$ and specified loading, and not guaranteed.
 3. CS# controls address buffer, WE# buffer, OE# buffer, and Din buffer. In data retention mode, V_{in} levels (address, WE#, OE#, I/O) can be in the high impedance state.
 4. t_{RC} = read cycle time.

Keep safety first in your circuit designs!

1. Renesas Technology Corp. puts the maximum effort into making semiconductor products better and more reliable, but there is always the possibility that trouble may occur with them. Trouble with semiconductors may lead to personal injury, fire or property damage. Remember to give due consideration to safety when making your circuit designs, with appropriate measures such as (i) placement of substitutive, auxiliary circuits, (ii) use of nonflammable material or (iii) prevention against any malfunction or mishap.

Notes regarding these materials
