

# FAN6961

## Critical Conduction Mode PFC Controller

### Features

- Boundary Mode PFC Controller
- Low Input Current THD
- Controlled On-Time PWM
- Zero-Current Detection
- Cycle-by-Cycle Current Limiting
- Leading-Edge Blanking instead of RC Filtering
- Low Start-up Current: 10µA Typical
- Low Operating Current: 4.5mA Typical
- Feedback Open-Loop Protection
- Programmable Maximum On-Time (MOT)
- Output Over-Voltage Clamping Protection
- Clamped Gate Output Voltage 16.5V

### Description

The FAN6961 is an 8-pin, boundary-mode, PFC controller IC intended for controlling PFC pre-regulators. The FAN6961 provides a controlled on-time to regulate the output DC voltage and achieve natural power factor correction. The maximum on-time of the external switch is programmable to ensure safe operation during AC brownouts. An innovative multi-vector error amplifier is built in to provide rapid transient response and precise output voltage clamping. A built-in circuit disables the controller if the output feedback loop is opened. The start-up current is lower than 20µA and the operating current has been reduced to under 6mA. The supply voltage can be up to 25V, maximizing application flexibility.

### Applications

- Electric Lamp Ballasts
- AC-DC Switching Mode Power Converter
- Open Frame Power Supplies and Power Adapters
- Flyback Power Converters with ZCS / ZVS

### Ordering Information

Part Number	Operating Temperature Range	Package	 Eco Status	Packing Method
FAN6961SZ	-40°C to +125°C	8-Pin, Small Outline Package (SOP)	RoHS	Tape & Reel
FAN6961DZ	-40°C to +125°C	8-Pin, Dual In-line Package (DIP)	RoHS	Tube

## Pin Configuration

Figure 4. DIP and SOP Pin Configuration (Top View)

## Pin Definitions

Pin #	Name	Description
1	INV	<b>Inverting input of the error amplifier.</b> INV is connected to the converter output via a resistive divider. This pin is also used for over-voltage clamping and open-loop feedback protection.
2	COMP	<b>The output of the error amplifier.</b> To create a precise clamping protection, a compensation network between this pin and GND is suggested.
3	MOT	<b>Maximum On Time</b> A resistor from MOT to GND is used to determine the maximum on-time of the external power MOSFET. The maximum output power of the converter is a function of the maximum on time.
4	CS	<b>Current Sense.</b> Input to the over-current protection comparator. When the sensed voltage across the sense resistor reaches the internal threshold (0.8V), the switch is turned off to activate cycle-by-cycle current limiting.
5	ZCD	<b>Zero Current Detection.</b> This pin is connected to an auxiliary winding via a resistor to detect the zero crossing of the switch current. When the zero crossing is detected, a new switching cycle is started. If it is connected to GND, the device is disabled.
6	GND	<b>Ground.</b> The power ground and signal ground. Placing a 0.1μF decoupling capacitor between VCC and GND is recommended.
7	GATE	<b>Driver output.</b> Totem-pole driver output to drive the external power MOSFET. The clamped gate output voltage is 16.5V.
8	VCC	<b>Power supply.</b> Driver and control circuit supply voltage.

## Absolute Maximum Ratings

Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only. All voltage values, except differential voltage, are given with respect to GND pin.

Symbol	Parameter	Min.	Max.	Unit
V <sub>VCC</sub>	DC Supply Voltage		30	V

## Functional Description

### Error Amplifier

The inverting input of the error amplifier is referenced to INV. The output of the error amplifier is referenced to COMP. The non-inverting input is internally connected to a fixed  $2.5V \pm 2\%$  voltage. The output of the error amplifier is used to determine the on-time of the PWM output and regulate the output voltage. To achieve a low input current THD, the variation of the on time within one input AC cycle should be very small. A multi-vector error amplifier is built in to provide fast transient response and precise output voltage clamping.

For FAN6961, connecting a capacitance, such as  $1\mu F$ , between COMP and GND is suggested. The error amplifier is a trans-conductance amplifier that converts voltage to current with a  $125\mu mho$ .

### Start-Up Current

Typical start-up current is less than  $20\mu A$ . This ultra-low start-up current allows the usage of high resistance, low-wattage start-up resistor. For example,  $1M\Omega/0.25W$  start-up resistor and a  $10\mu F/25V$  ( $V_{CC}$  hold-up) capacitor are recommended for an AC-to-DC power adaptor with a wide input range  $85-265V_{AC}$ .

### Operating Current

Operating current is typically  $4.5mA$ . The low operating current enables a better efficiency and reduces the requirement of  $V_{CC}$  hold-up capacitance.

### Maximum On-Time Operation

Given a fixed inductor value and maximum output power, the relationship between on-time and line voltage is:

$$t_{on} = \frac{2 \cdot L \cdot P_o}{V_{rms}^2 \cdot \eta} \quad (1)$$

If the line voltage is too low or the inductor value is too high,  $t_{ON}$  is too long. To avoid extra low operating frequency and achieve brownout protection, the maximum value of  $t_{ON}$  is programmable by one resistor,  $R_i$ , connected between MOT and GND. A  $24k\Omega$  resistor  $R_i$  generates corresponds to  $25\mu s$  maximum on time:

$$t_{on(max)} = R_i(k\Omega) \cdot \frac{25}{24}(\mu s) \quad (2)$$

The range of the maximum on-time is designed as  $10 \sim 50\mu s$ .

### Peak Current Limiting

The switch current is sensed by one resistor. The signal is feed into CS pin and an input terminal of a comparator. A high voltage in CS pin terminates a switching cycle immediately and cycle-by-cycle current limit is achieved. The designed threshold of the protection point is  $0.82V$ .

### Leading-Edge Blanking (LEB)

A turn-on spike on CS pin appears when the power MOSFET is switched on. At the beginning of each switching pulse, the current-limit comparator is disabled for around  $400ns$  to avoid premature termination. The gate drive output cannot be switched off during the blanking period. Conventional RC filtering is not necessary, so the propagation delay of current limit protection can be minimized.

### Under-Voltage Lockout (UVLO)

The turn-on and turn-off threshold voltage is fixed internally at  $12V/9.5V$ . This hysteresis behavior guarantees a one-shot start-up with proper start-up resistor and hold-up capacitor. With an ultra-low start-up current of  $20\mu A$ , one  $1M\Omega R_{IN}$  is sufficient for start-up under low input line voltage,  $85V_{rms}$ . Power dissipation on  $R_{IN}$  would be less than  $0.1W$  even under high line ( $V_{AC}=265V_{rms}$ ) condition.

### Output Driver

With low on resistance and high current driving capability, the output driver can drive an external capacitive load larger than  $3000pF$ . Cross conduction current has been avoided to minimize heat dissipation, improving efficiency and reliability. This output driver is internally clamped by a  $16.5V$  Zener diode.

### Zero-Current Detection (ZCD)

The zero-current detection of the inductor is achieved using its auxiliary winding. When the stored energy of the inductor is fully released to output, the voltage on ZCD goes down and a new switching cycle is enabled after a ZCD trigger. The power MOSFET is always turned on with zero inductor current such that turn-on loss and noise can be minimized. The converter works in boundary mode and peak inductor current is always exactly twice of the average current. A natural power factor correction function is achieved with the low-bandwidth, on-time modulation. An inherent maximum off time is built in to ensure proper start-up operation. This ZCD pin can be used as a synchronous input.

### Noise Immunity

Noise on the current sense or control signal can cause significant pulse-width jitter, particularly in the boundary-mode operation. Slope compensation and built-in debounce circuit can alleviate this problem. Because the FAN6961 has a single ground pin, high sink current at the output cannot be returned separately. Good high-frequency or RF layout practices should be followed. Avoiding long PCB traces and component leads, locating compensation and filter components near to the FAN6961, and increasing the power MOSFET gate resistance improve performance.

**WARNING AND DISCLAIMER**

Replace components on the Evaluation Board only with those parts shown on the parts list (or Bill of Materials) in the Users' Guide. Contact an authorized Fairchild representative with any questions.

The Evaluation board (or kit) is for demonstration purposes only and neither the Board nor this User's Guide constitute a sales contract or create any kind of warranty, whether express or implied, as to the applications or products involved. Fairchild warrants that its products meet Fairchild's published specifications, but does not guarantee that its products work in any specific application. Fairchild reserves the right to make changes without notice to any products described herein to improve reliability, function, or design. Either the applicable sales contract signed by Fairchild and Buyer or, if no contract exists, Fairchild's standard Terms and Conditions on the back of Fairchild invoices, govern the terms of sale of the products described herein.

**DISCLAIMER**

FAIRCHILD SEMICONDUCTOR RESERVES THE RIGHT TO MAKE CHANGES WITHOUT FURTHER NOTICE TO ANY PRODUCTS HEREIN TO IMPROVE RELIABILITY, FUNCTION, OR DESIGN. FAIRCHILD DOES NOT ASSUME ANY LIABILITY ARISING OUT OF THE APPLICATION OR USE OF ANY PRODUCT OR CIRCUIT DESCRIBED HEREIN; NEITHER DOES IT CONVEY ANY LICENSE UNDER ITS PATENT RIGHTS, NOR THE RIGHTS OF OTHERS.

**LIFE SUPPORT POLICY**

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF FAIRCHILD SEMICONDUCTOR CORPORATION.

As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, or (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

**ANTI-COUNTERFEITING POLICY**

Fairchild Semiconductor Corporation's Anti-Counterfeiting Policy. Fairchild's Anti-Counterfeiting Policy is also stated on our external website, [www.fairchildsemi.com](http://www.fairchildsemi.com), under Sales Support.

Counterfeiting of semiconductor parts is a growing problem in the industry. All manufacturers of semiconductor products are experiencing counterfeiting of their parts. Customers who inadvertently purchase counterfeit parts experience many problems such as loss of brand reputation, substandard performance, failed applications, and increased cost of production and manufacturing delays. Fairchild is taking strong measures to protect ourselves and our customers from the proliferation of counterfeit parts. Fairchild strongly encourages customers to purchase Fairchild parts either directly from Fairchild or from Authorized Fairchild Distributors who are listed by country on our web page cited above. Products customers buy either from Fairchild directly or from Authorized Fairchild Distributors are genuine parts, have full traceability, meet Fairchild's quality standards for handling and storage and provide access to Fairchild's full range of up-to-date technical and product information. Fairchild and our Authorized Distributors will stand behind all warranties and will appropriately address any warranty issues that may arise. Fairchild will not provide any warranty coverage or other assistance for parts bought from Unauthorized Sources. Fairchild is committed to combat this global problem and encourage our customers to do their part in stopping this practice by buying direct or from authorized distributors.
