

Radiation-Tolerant ProASIC3 Low-Power Space-Flight Flash FPGAs

with Flash*Freeze Technology

Features and Benefits

MIL-STD-883 Class B Qualified Packaging

- Ceramic Column Grid Array with Six Sigma Copper-Wrapped Lead-Tin Columns
- Land Grid Array

Low Power

- Dramatic Reduction in Dynamic and Static Power
- 1.2 V to 1.5 V Core and I/O Voltage Support for Low Power
- Low Power Consumption in Flash*Freeze Mode Enables Instantaneous Entry To / Exit From Low-Power Flash*Freeze Mode
- Supports Single-Voltage System Operation
- Low-Impedance Switches

Radiation Tolerant

- 15 krad Total Ionizing Dose (TID)
- Wafer-Lot-Specific TID Reports

High Capacity

- 600 k to 3 M System Gates
- Up to 504 kbits of True Dual-Port SRAM
- Up to 620 User I/Os

Reprogrammable Flash Technology

- 130-nm, 7-Layer Metal (6 Copper), Flash-Based CMOS Process
- Live-at-Power-Up (LAPU) Level 0 Support
- Single-Chip Solution
- Retains Programmed Design when Powered Off

High Performance

- 350 MHz (1.5 V) and 250 MHz (1.2 V) System Performance
- 3.3 V, 66 MHz, 66-Bit PCI (1.5 V); 66 MHz, 32-Bit PCI (1.2 V)

In-System Programming (ISP) and Security

- Secure ISP Using On-Chip 128-Bit Advanced Encryption Standard (AES) Decryption via JTAG (IEEE 1532-compliant)
- FlashLock[®] to Secure FPGA Contents

High-Performance Routing Hierarchy

- Segmented, Hierarchical Routing and Clock Structure

- High-Performance, Low-Skew Global Network
- Architecture Supports Ultra-High Utilization

Advanced and Pro (Professional) I/Os

- 700 Mbps DDR, LVDS-Capable I/Os
- 1.2 V, 1.5 V, 1.8 V, 2.5 V, and 3.3 V Mixed-Voltage Operation
- Bank-Selectable I/O Voltages—up to 8 Banks per Chip
- Single-Ended I/O Standards: LVTTTL, LVCMOS 3.3 V / 2.5 V / 1.8 V / 1.5 V / 1.2 V, 3.3 V PCI / 3.3 V PCI-X, and LVCMOS 2.5 V / 5.0 V Input
- Differential I/O Standards: LVPECL, LVDS, B-LVDS, and M-LVDS
- Voltage-Referenced I/O Standards: GTL+ 2.5 V / 3.3 V, GTL 2.5 V / 3.3 V, HSTL Class I and II, SSTL2 Class I and II, SSTL3 Class I and II (RT3PE3000L only)
- I/O Registers on Input, Output, and Enable Paths
- Hot-Swappable and Cold-Sparing I/Os
- Programmable Output Slew Rate and Drive Strength
- Programmable Input Delay (RT3PE3000L only)
- Schmitt Trigger Option on Single-Ended Inputs (RT3PE3000L)
- Weak Pull-Up/-Down
- IEEE 1149.1 (JTAG) Boundary Scan Test
- Pin-Compatible Packages across the Radiation-Tolerant ProASIC[®]3 Family

Clock Conditioning Circuit (CCC) and PLL

- Six CCC Blocks, All with Integrated PLL (RT ProASIC3)
- Configurable Phase Shift, Multiply/Divide, Delay Capabilities, and External Feedback
- Wide Input Frequency Range 1.5 MHz to 250 MHz (1.2 V systems) and 350 MHz (1.5 V systems)

SRAMs and FIFOs

- Variable-Aspect-Ratio 4,608-Bit RAM Blocks (x1, x2, x4, x9, and x18 organizations available)
- True Dual-Port SRAM (except x18)
- 24 SRAM and FIFO Blocks with Synchronous Operation:
 - 250 MHz: For 1.2 V Systems
 - 350 MHz: For 1.5 V Systems

Table I-1 • Radiation-Tolerant (RT) ProASIC3 Low-Power Space-Flight FPGAs

RT ProASIC3 Devices	RT3PE600L	RT3PE3000L
System Gates	600 k	3 M
VersaTiles (D-flip-flops)	13,824	75,264
RAM kbits (1,024 bits)	108	504
4,608-Bit Blocks	24	112
FlashROM Bits	1 k	1 k
Secure (AES) ISP	Yes	Yes
Integrated PLL in CCCs	6	6
VersaNet Globals	18	18
I/O Banks	8	8
Maximum User I/Os	270	620
Package Pins CCGA/LGA	CG/LG484	CG/LG484, CG/LG896

I/Os Per Package¹

Radiation-Tolerant ProASIC3 Low-Power Devices	RT3PE600L		RT3PE3000L	
	Single-Ended I/Os ²	Differential I/O Pairs	Single-Ended I/Os ²	Differential I/O Pairs
CG/LG484	270	135	341	168
CG/LG896	–	–	620	300

Notes:

1. When considering migrating your design to a lower- or higher-density device, refer to the packaging section of the datasheet to ensure you are complying with design and board migration requirements.
2. Each used differential I/O pair reduces the number of single-ended I/Os available by two.
3. For RT3PE3000L devices, the usage of certain I/O standards is limited as follows:
 - SSTL3(I) and (II): up to 40 I/Os per north or south bank
 - LVPECL / GTL+ 3.3 V / GTL 3.3 V: up to 48 I/Os per north or south bank
 - SSTL2(I) and (II) / GTL+ 2.5 V / GTL 2.5 V: up to 72 I/Os per north or south bank
4. When the Flash*Freeze pin is used to directly enable Flash*Freeze mode and not as a regular I/O, the number of single-ended user I/Os available is reduced by one.

1 – Radiation-Tolerant ProASIC3 Low-Power Space-Flight FPGA Overview

General Description

The radiation-tolerant (RT) ProASIC3 family of Actel flash FPGAs dramatically reduces dynamic power consumption by 40% and static power by 50%. These power savings are coupled with performance, density, true single chip, 1.2 V to 1.5 V core and I/O operation, reprogrammability, and advanced features. The RT ProASIC3 FPGA is based on Actel's ProASIC3EL family of low-power FPGAs.

Actel's proven Flash*Freeze technology enables RT ProASIC3 device users to shut off dynamic power instantaneously and switch the device to static mode without the need to switch off clocks or power supplies, and retaining internal states of the device. This greatly simplifies power management. In addition, optimized software tools using power-driven layout provide instant push-button power reduction.

Nonvolatile flash technology gives RT ProASIC3 devices the advantage of being a secure, low-power, single-chip solution that is live at power-up (LAPU). RT ProASIC3 devices offer dramatic dynamic power savings, giving FPGA users flexibility to combine low power with high performance.

These features enable designers to create high-density systems using existing ASIC or FPGA design flows and tools.

RT ProASIC3 devices offer 1 kbit of on-chip, reprogrammable, nonvolatile FlashROM storage as well as clock conditioning circuitry (CCC) based on an integrated phase-locked loop (PLL). RT ProASIC3 devices support devices from 600 k system gates to 3 million system gates with up to 504 kbits of true dual-port SRAM and 620 user I/Os.

Flash*Freeze Technology

RT ProASIC3 devices offer Actel's proven Flash*Freeze technology, which allows instantaneous switching from an active state to a static state. When Flash*Freeze mode is activated, RT ProASIC3 devices enter a static state while retaining the contents of registers and SRAM. Power is conserved without the need for additional external components to turn off I/Os or clocks. Flash*Freeze technology is combined with in-system programmability, which enables users to quickly and easily upgrade and update their designs in the final stages of manufacturing or in the field. The ability of RT ProASIC3 devices to support a 1.2 V core voltage allows for an even greater reduction in power consumption, which enables low total system power.

When the RT ProASIC3 device enters Flash*Freeze mode, the device automatically shuts off the clocks and inputs to the FPGA core; when the device exits Flash*Freeze mode, all activity resumes and data is retained.

The availability of low-power modes, combined with a reprogrammable, single-chip, single-voltage solution, make RT ProASIC3 devices suitable for low-power data transfer and manipulation in military-temperature applications where available power may be limited (e.g., in battery-powered equipment); or where heat dissipation may be limited (e.g., in enclosures with no forced cooling).

Flash Advantages

Low Power

The RT ProASIC3 family of Actel flash-based FPGAs provides a low-power advantage, and when coupled with high performance, enables designers to make power-smart choices using a single-chip, reprogrammable, and live-at-power-up device.

RT ProASIC3 devices offer 40% dynamic power and 50% static power savings by reducing the core operating voltage to 1.2 V. In addition, the power-driven layout (PDL) feature in Libero® Integrated Design Environment (IDE) offers up to 30% additional power reduction. With Flash*Freeze

technology, an RT ProASIC3 device is able to retain device SRAM and logic while dynamic power is reduced to a minimum, without the need to stop clock or power supplies. Combining these features provides a low-power, feature-rich, and high-performance solution.

Security

Nonvolatile, flash-based RT ProASIC3 devices do not require a boot PROM, so there is no vulnerable external bitstream that can be easily copied. RT ProASIC3 devices incorporate FlashLock, which provides a unique combination of reprogrammability and design security without external overhead, advantages that only an FPGA with nonvolatile flash programming can offer.

RT ProASIC3 devices utilize a 128-bit flash-based lock and a separate AES key to secure programmed intellectual property and configuration data. In addition, all FlashROM data in RT ProASIC3 devices can be encrypted prior to loading, using the industry-leading AES-128 (FIPS192) bit block cipher encryption standard. AES was adopted by the National Institute of Standards and Technology (NIST) in 2000 and replaces the 1977 DES standard. RT ProASIC3 devices have a built-in AES decryption engine and a flash-based AES key that make them the most comprehensive programmable logic device security solution available today. RT ProASIC3 devices with AES-based security allow for secure, remote field updates over public networks such as the Internet, and ensure that valuable IP remains out of the hands of system overbuilders, system cloners, and IP thieves. The contents of a programmed device cannot be read back, although secure design verification is possible.

Security, built into the FPGA fabric, is an inherent component of the RT ProASIC3 family. The flash cells are located beneath seven metal layers, and many device design and layout techniques have been used to make invasive attacks extremely difficult. The RT ProASIC3 family, with FlashLock and AES security, is unique in being highly resistant to both invasive and noninvasive attacks. Your valuable IP is protected and secure, making remote ISP possible. An RT ProASIC3 device provides the most impenetrable security for programmable logic designs.

Single Chip

Flash-based FPGAs store their configuration information in on-chip flash cells. Once programmed, the configuration data is an inherent part of the FPGA structure, and no external configuration data needs to be loaded at system power-up (unlike SRAM-based FPGAs). Therefore, flash-based RT ProASIC3 FPGAs do not require system configuration components such as EEPROMs or microcontrollers to load device configuration data. This reduces bill-of-materials costs and PCB area, and increases security and system reliability.

Live at Power-Up

Actel flash-based RT ProASIC3 devices support Level 0 of the LAPU classification standard. This feature helps in system component initialization, execution of critical tasks before the processor wakes up, setup and configuration of memory blocks, clock generation, and bus activity management. The LAPU feature of flash-based RT ProASIC3 devices greatly simplifies total system design and reduces total system cost, often eliminating the need for CPLDs and clock generation PLLs. In addition, glitches and brownouts in system power will not corrupt the device's flash configuration, and unlike SRAM-based FPGAs, the device will not have to be reloaded when system power is restored. This enables the reduction or complete removal of the configuration PROM, expensive voltage monitor, brownout detection, and clock generator devices from the PCB design. Flash-based RT ProASIC3 devices simplify total system design and reduce cost and design risk while increasing system reliability and improving system initialization time.

Reduced Cost of Ownership

Advantages to the designer extend beyond low unit cost, performance, and ease of use. Unlike SRAM-based FPGAs, flash-based RT ProASIC3 devices allow all functionality to be live at power-up; no external boot PROM is required. On-board security mechanisms prevent access to all the programming information and enable secure remote updates of the FPGA logic. Designers can perform secure remote in-system reprogramming to support future design iterations and field upgrades with confidence that valuable intellectual property cannot be compromised or copied. Secure ISP can be performed using the industry-standard AES algorithm. The RT ProASIC3 family device architecture mitigates the need for ASIC migration at higher volumes. This makes the RT ProASIC3 family a cost-effective ASIC replacement.

Advanced Flash Technology

The RT ProASIC3 family offers many benefits, including nonvolatility and reprogrammability, through an advanced flash-based, 130-nm LVC MOS process with 7 layers of metal. Standard CMOS design techniques are used to implement logic and control functions. The combination of fine granularity, enhanced flexible routing resources, and abundant flash switches allows for very high logic utilization without compromising device routability or performance. Logic functions within the device are interconnected through a four-level routing hierarchy.

Advanced Architecture

The proprietary RT ProASIC3 architecture provides granularity comparable to standard-cell ASICs. The RT ProASIC3 device consists of five distinct and programmable architectural features (Figure 1-1):

- FPGA VersaTiles
- Dedicated FlashROM
- Dedicated SRAM/FIFO memory
- Extensive CCCs and PLLs
- I/O structure

The FPGA core consists of a sea of VersaTiles. Each VersaTile can be configured as a three-input logic function, a D-flip-flop (with or without enable), or a latch by programming the appropriate flash switch interconnections. The versatility of the RT ProASIC3 core tile, as either a three-input lookup table (LUT) equivalent or a D-flip-flop/latch with enable, allows for efficient use of the FPGA fabric. The VersaTile capability is unique to the Actel ProASIC family of third-generation-architecture flash FPGAs. VersaTiles are connected with any of the four levels of routing hierarchy. Flash switches are distributed throughout the device to provide nonvolatile, reconfigurable interconnect programming. Maximum core utilization is possible for virtually any design.

In addition, extensive on-chip programming circuitry allows for rapid, single-voltage (3.3 V) programming of RT ProASIC3 devices via an IEEE 1532 JTAG interface.

Figure 1-1 • RT ProASIC3 Device Architecture Overview

Flash*Freeze Technology

RT ProASIC3 devices offer Actel's proven Flash*Freeze technology, which enables designers to instantaneously shut off dynamic power consumption while retaining all SRAM and register information. Flash*Freeze technology enables the user to quickly (within 1 μ s) enter and exit Flash*Freeze mode by activating the Flash*Freeze (FF) pin while all power supplies are kept at their original values. In addition, I/Os and global I/Os can still be driven and can be toggling without impact on power consumption; clocks can still be driven or can be toggling without impact on power consumption; all core registers and SRAM cells retain their states. I/Os are tristated during Flash*Freeze mode or can be set to a certain state using weak pull-up or pull-down I/O attribute configuration. No power is consumed by the I/O banks, clocks, JTAG pins, or PLLs. Flash*Freeze technology allows the user to switch to active mode on demand, thus simplifying the power management of the device.

The FF pin (active low) can be routed internally to the core to allow the user's logic to decide when it is safe to transition to this mode. It is also possible to use the FF pin as a regular I/O if Flash*Freeze mode usage is not planned, which is advantageous because of the inherent low-power static and dynamic capabilities of the RT ProASIC3 device. Refer to [Figure 1-2](#) for an illustration of entering/exiting Flash*Freeze mode.

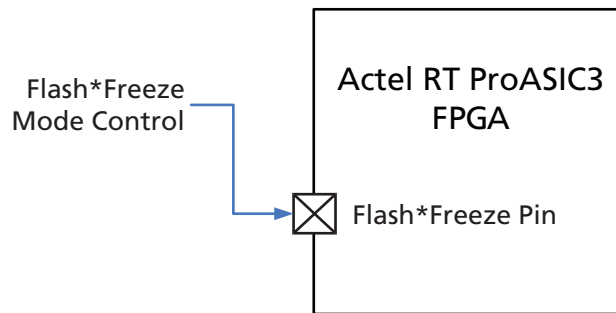

Figure 1-2 • RT ProASIC3 Flash*Freeze Mode

VersaTiles

The RT ProASIC3 core consists of VersaTiles, which have been enhanced beyond the ProASIC^{PLUS}® core tiles. The RT ProASIC3 VersaTile supports the following:

- All 3-input logic functions—LUT-3 equivalent
- Latch with clear or set
- D-flip-flop with clear or set
- Enable D-flip-flop with clear or set

Refer to [Figure 1-3](#) for VersaTile configurations.

Figure 1-3 • VersaTile Configurations

User Nonvolatile FlashROM

Actel RT ProASIC3 devices have 1 kbit of on-chip, user-accessible, nonvolatile FlashROM. The FlashROM can be used in diverse system applications:

- Internet protocol addressing (wireless or fixed)
- System calibration settings
- Device serialization and/or inventory control
- Subscription-based business models (for example, set-top boxes)
- Secure key storage for secure communications algorithms
- Asset management/tracking
- Date stamping
- Version management

FlashROM is written using the standard RT ProASIC3 IEEE 1532 JTAG programming interface. The core can be individually programmed (erased and written), and on-chip AES decryption can be used selectively to securely load data over public networks, as in security keys stored in the FlashROM for a user design.

FlashROM can be programmed via the JTAG programming interface, and its contents can be read back either through the JTAG programming interface or via direct FPGA core addressing. Note that the FlashROM can only be programmed from the JTAG interface and cannot be programmed from the internal logic array.

FlashROM is programmed as 8 banks of 128 bits; however, reading is performed on a byte-by-byte basis using a synchronous interface. A 7-bit address from the FPGA core defines which of the 8 banks and which of the 16 bytes within that bank are being read. The three most significant bits (MSBs) of the FlashROM address determine the bank, and the four least significant bits (LSBs) of the FlashROM address define the byte.

The Actel RT ProASIC3 development software solutions, Libero IDE and Designer, have extensive support for the FlashROM. One such feature is auto-generation of sequential programming files for applications requiring a unique serial number in each part. Another feature allows the inclusion of static data for system version control. Data for the FlashROM can be generated quickly and easily using Actel Libero IDE and Designer software tools. Comprehensive programming file support is also included to allow for easy programming of large numbers of parts with differing FlashROM contents.

SRAM and FIFO

RT ProASIC3 devices have embedded SRAM blocks along their north and south sides. Each variable-aspect-ratio SRAM block is 4,608 bits in size. Available memory configurations are 256×18, 512×9, 1k×4, 2k×2, and 4k×1 bits. The individual blocks have independent read and write ports that can be configured with different bit widths on each port. For example, data can be sent through a 4-bit port and read as a single bitstream. The embedded SRAM blocks can be initialized via the device JTAG port (ROM emulation mode) using the UJTAG macro.

In addition, every SRAM block has an embedded FIFO control unit. The control unit allows the SRAM block to be configured as a synchronous FIFO without using additional core VersaTiles. The FIFO width and depth are programmable. The FIFO also features programmable Almost Empty (AEMPTY) and Almost Full (AFULL) flags in addition to the normal Empty and Full flags. The embedded FIFO control unit contains the counters necessary for generation of the read and write address pointers. The embedded SRAM/FIFO blocks can be cascaded to create larger configurations.

PLL and CCC

RT ProASIC3 space-flight FPGAs provide designers with flexible clock conditioning circuit (CCC) capabilities. Each member of the RT ProASIC3 family contains six CCCs, located at the four corners and the centers of the east and west sides. All six CCC blocks are equipped with a PLL. All six CCC blocks are usable; the four corner CCCs and the east CCC allow simple clock delay operations as well as clock spine access.

The inputs of the six CCC blocks are accessible from the FPGA core or from one of several inputs located near the CCC that have dedicated connections to the CCC block.

The CCC block has these key features:

- Wide input frequency range (f_{IN_CCC}) = 1.5 MHz up to 250 MHz
- Output frequency range (f_{OUT_CCC}) = 0.75 MHz up to 250 MHz
- 2 programmable delay types for clock skew minimization
- Clock frequency synthesis

Additional CCC specifications:

- Internal phase shift = 0°, 90°, 180°, and 270°. Output phase shift depends on the output divider configuration.
- Output duty cycle = 50% \pm 1.5% or better
- Low output jitter: worst case < 2.5% \times clock period peak-to-peak period jitter when single global network used
- Maximum acquisition time is 300 μ s
- Exceptional tolerance to input period jitter—allowable input jitter is up to 1.5 ns
- Four precise phases; maximum misalignment between adjacent phases of 40 ps \times 250 MHz / f_{OUT_CCC}

Global Clocking

RT ProASIC3 devices have extensive support for multiple clocking domains. In addition to the CCC and PLL support described above, there is a comprehensive global clock distribution network.

Each VersaTile input and output port has access to nine VersaNets: six chip (main) and three quadrant global networks. The VersaNets can be driven by the CCC or directly accessed from the core via multiplexers (MUXes). The VersaNets can be used to distribute low-skew clock signals or for rapid distribution of high-fanout nets.

I/Os with Advanced I/O Standards

The RT ProASIC3 family of FPGAs features a flexible I/O structure, supporting a range of voltages (1.5 V, 1.8 V, 2.5 V, and 3.3 V). In addition, 1.2 V I/O operation is supported for RT ProASIC3 devices. RT ProASIC3 FPGAs support different I/O standards, including single-ended, differential, and voltage-referenced. The I/Os are organized into banks, with eight banks per device. The configuration of these banks determines the I/O standards supported. For RT ProASIC3, each I/O bank is subdivided into V_{REF} minibanks, which are used by voltage-referenced I/Os. V_{REF} minibanks contain 8 to 18 I/Os. All the I/Os in a given minibank share a common V_{REF} line. Therefore, if any I/O in a given V_{REF} minibank is configured as a V_{REF} pin, the remaining I/Os in that minibank will be able to use that reference voltage.

Each I/O module contains several input, output, and enable registers. These registers allow the implementation of the following:

- Single-data-rate applications (e.g., PCI 66 MHz, bidirectional SSTL 2 and 3, Class I and II)
- Double-data-Rate applications (e.g., DDR LVDS, B-LVDS, and M-LVDS I/Os for point-to-point communications, and DDR 200 MHz SRAM using bidirectional HSTL Class II).

RT ProASIC3 banks support LVPECL, LVDS, B-LVDS, and M-LVDS. B-LVDS and M-LVDS can support up to 20 loads.

Part Number and Revision Date

Part Number 51700107-001-0

Revised September 2008

Datasheet Categories

Categories

In order to provide the latest information to designers, some datasheets are published before data has been fully characterized. Datasheets are designated as "Product Brief," "Advance," "Preliminary," and "Production." The definition of these categories are as follows:

Product Brief

The product brief is a summarized version of a datasheet (advance or production) and contains general product information. This document gives an overview of specific device and family information.

Advance

This version contains initial estimated information based on simulation, other products, devices, or speed grades. This information can be used as estimates, but not for production. This label only applies to the DC and Switching Characteristics chapter of the datasheet and will only be used when the data has not been fully characterized.

Preliminary

The datasheet contains information based on simulation and/or initial characterization. The information is believed to be correct, but changes are possible.

Unmarked (production)

This version contains information that is considered to be final.

Export Administration Regulations (EAR)

The products described in this document are subject to the Export Administration Regulations (EAR). They could require an approved export license prior to export from the United States. An export includes release of product or disclosure of technology to a foreign national inside or outside the United States.

Actel Safety Critical, Life Support, and High-Reliability Applications Policy

The Actel products described in this advance status document may not have completed Actel's qualification process. Actel may amend or enhance products during the product introduction and qualification process, resulting in changes in device functionality or performance. It is the responsibility of each customer to ensure the fitness of any Actel product (but especially a new product) for a particular purpose, including appropriateness for safety-critical, life-support, and other high-reliability applications. Consult Actel's Terms and Conditions for specific liability exclusions relating to life-support applications. A reliability report covering all of Actel's products is available on the Actel website at http://www.actel.com/documents/ORT_Report.pdf. Actel also offers a variety of enhanced qualification and lot acceptance screening procedures. Contact your local Actel sales office for additional reliability information.

2 – Radiation-Tolerant ProASIC3 DC and Switching Characteristics

General Specifications

Operating Conditions

Stresses beyond those listed in [Table 2-1](#) may cause permanent damage to the device.

Exposure to absolute maximum rating conditions for extended periods may affect device reliability. absolute maximum ratings are stress ratings only; functional operation of the device at these or any other conditions beyond those listed under the Recommended Operating Conditions specified in [Table 2-2 on page 2-2](#) is not implied.

Table 2-1 • Absolute Maximum Ratings

Symbol	Parameter	Limits	Units
V_{CC}	DC core supply voltage	-0.3 to 1.65	V
V_{JTAG}	JTAG DC voltage	-0.3 to 3.75	V
V_{PUMP}	Programming voltage	-0.3 to 3.75	V
V_{CCPLL}	Analog power supply (PLL)	-0.3 to 1.65	V
V_{CCI} and VMV^3	DC I/O buffer supply voltage	-0.3 to 3.75	V
V_I	I/O input voltage	-0.3 V to 3.6 V (when I/O hot insertion mode is enabled) -0.3 V to ($V_{CCI} + 1$ V) or 3.6 V, whichever voltage is lower (when I/O hot-insertion mode is disabled)	V
T_{STG}^2	Storage temperature	-65 to +150	°C
T_J^2	Junction temperature	+150	°C

Notes:

1. The device should be operated within the limits specified by the datasheet. During transitions, the input signal may undershoot or overshoot according to the limits shown in [Table 2-4 on page 2-7](#).
2. For flash programming and retention maximum limits, refer to [Table 2-3 on page 2-3](#), and for recommended operating limits, refer to [Table 2-2 on page 2-2](#).
3. VMV pins must be connected to the corresponding V_{CCI} pins. Refer to the [Pin Descriptions](#) chapter for further information.

Table 2-2 • Recommended Operating Conditions²

Symbol	Parameter		Military	Units
T _A	Ambient temperature		-55 to 125	°C
T _J	Junction temperature		-55 to 125	°C
V _{CC}	DC core supply voltage		1.14 to 1.575	V
V _{JTAG}	JTAG DC voltage		1.4 to 3.45	V
V _{PUMP} ³	Programming voltage	Programming mode	3.15 to 3.45	V
		Operation ³	0 to 3.6	V
V _{CCPLL}	Analog power supply (PLL)	DC core supply voltage	1.14 to 1.575	V
V _{CCI} and VMV ⁴	1.2 V DC supply voltage		1.14 to 1.26	V
	1.5 V DC supply voltage		1.425 to 1.575	V
	1.8 V DC supply voltage		1.7 to 1.9	V
	2.5 V DC supply voltage		2.3 to 2.7	V
	3.3 V DC supply voltage		3.0 to 3.6	V
	LVDS differential I/O		2.375 to 2.625	V
	LVPECL differential I/O		3.0 to 3.6	V

Notes:

1. The ranges given here are for power supplies only. The recommended input voltage ranges specific to each I/O standard are given in Table 2-17 on page 2-22. VMV and V_{CCI} should be at the same voltage within a given I/O bank.
2. All parameters representing voltages are measured with respect to GND unless otherwise specified.
3. V_{PUMP} can be left floating during normal operation (not programming mode).
4. VMV pins must be connected to the corresponding V_{CCI} pins. See the Pin Descriptions chapter for further information.

T _j (°C)	HTR Lifetime (yrs)
70	102.7
85	43.8
100	20.0
105	15.6
110	12.3
115	9.7
120	7.7
125	6.2
130	5.0
135	4.0
140	3.3
145	2.7
150	2.2

Note: HTR time is the period during which you would not expect a verify failure due to flash cell leakage.

Figure 2-1 • High-Temperature Data Retention (HTR)

Table 2-3 • Overshoot and Undershoot Limits

V _{CC1} and VMV	Average V _{CC1} -GND Overshoot or Undershoot Duration as a Percentage of Clock Cycle	Maximum Overshoot/Undershoot (125°C)
2.7 V or less	10%	0.72 V
	5%	0.82 V
3 V	10%	0.72 V
	5%	0.81 V
3.3 V	10%	0.69 V
	5%	0.79 V
3.6 V	10%	N/A
	5%	N/A

Notes:

1. The duration is allowed at one out of six clock cycles. If the overshoot/undershoot occurs at one out of two cycles, the maximum overshoot/undershoot has to be reduced by 0.15 V.
2. This table does not provide PCI overshoot/undershoot limits.

I/O Power-Up and Supply Voltage Thresholds for Power-On Reset

Sophisticated power-up management circuitry is designed into every ProASIC[®]3 device. These circuits ensure easy transition from the powered-off state to the powered-up state of the device. The many different supplies can power up in any sequence with minimized current spikes or surges. In addition, the I/O will be in a known state through the power-up sequence. The basic principle is shown in [Figure 2-2 on page 2-5](#) and [Figure 2-3 on page 2-6](#).

There are five regions to consider during power-up.

RT ProASIC3 I/Os are activated only if ALL of the following three conditions are met:

1. V_{CC} and V_{CCI} are above the minimum specified trip points ([Figure 2-2 on page 2-5](#) and [Figure 2-3 on page 2-6](#)).
2. $V_{CCI} > V_{CC} - 0.75$ V (typical)
3. Chip is in the operating mode.

V_{CCI} Trip Point:

Ramping up: 0.6 V < trip_point_up < 1.2 V

Ramping down: 0.5 V < trip_point_down < 1.1 V

V_{CC} Trip Point:

Ramping up: 0.6 V < trip_point_up < 1.1 V

Ramping down: 0.5 V < trip_point_down < 1 V

V_{CC} and V_{CCI} ramp-up trip points are about 100 mV higher than ramp-down trip points. This specifically built-in hysteresis prevents undesirable power-up oscillations and current surges. Note the following:

- During programming, I/Os become tristated and weakly pulled up to V_{CCI} .
- JTAG supply, PLL power supplies, and charge pump V_{PUMP} supply have no influence on I/O behavior.

PLL Behavior at Brownout Condition

Actel recommends using monotonic power supplies or voltage regulators to ensure proper power-up behavior. Power ramp-up should be monotonic, at least until V_{CC} and V_{CCPLX} exceed brownout activation levels. The V_{CC} activation level is specified as 1.1 V worst-case (see Figure 2-2 and Figure 2-3 on page 2-6 for more details).

When PLL power supply voltage and/or V_{CC} levels drop below the V_{CC} brownout levels ($0.75\text{ V} \pm 0.25\text{ V}$), the PLL output lock signal goes low and/or the output clock is lost. Refer to the *Power-Up/Down Behavior of Low-Power Flash Devices* chapter of the handbook for information on clock and lock recovery.

Internal Power-Up Activation Sequence

1. Core
2. Input buffers

Output buffers, after 200 ns delay from input buffer activation.

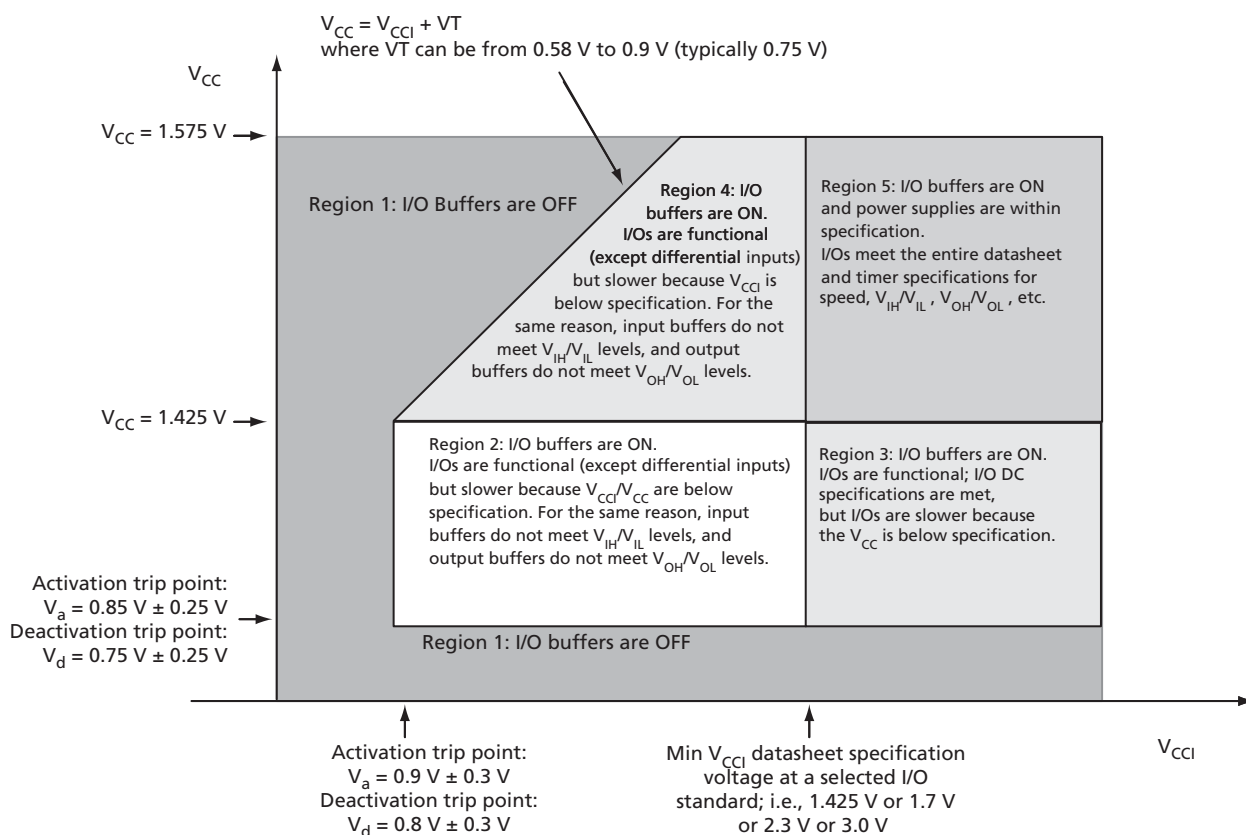

Figure 2-2 • Devices Operating at 1.5 V Core – I/O State as a Function of V_{CCI} and V_{CC} Voltage Levels

Figure 2-3 • Device Operating at 1.2 V Core Voltage – I/O State as a Function of V_{CCI} and V_{CC} Voltage Levels

Thermal Characteristics

Introduction

The temperature variable in the Actel Designer software refers to the junction temperature, not the ambient temperature. This is an important distinction because dynamic and static power consumption cause the chip junction temperature to be higher than the ambient temperature.

EQ 2-1 can be used to calculate junction temperature.

$$T_J = \text{Junction Temperature} = \Delta T + T_A$$

EQ 2-1

where:

T_A = Ambient Temperature

ΔT = Temperature gradient between junction (silicon) and ambient $\Delta T = \theta_{ja} * P$

θ_{ja} = Junction-to-ambient of the package. θ_{ja} numbers are located in Table 2-4.

P = Power dissipation

Package Thermal Characteristics

The device junction-to-case thermal resistivity is θ_{jc} and the junction-to-ambient air thermal resistivity is θ_{ja} . The thermal characteristics for θ_{ja} are shown for two air flow rates. The recommended maximum junction temperature is 125°C. EQ 2-2 shows a sample calculation of the recommended maximum power dissipation allowed for a 484-pin CCGA package with the junction at 125°C and with the case temperature maintained at 70°C.

$$\text{Maximum Power Allowed} = \frac{\text{Max. junction temp. (}^\circ\text{C)} - \text{Max. case temp. (}^\circ\text{C)}}{\theta_{jc} (^\circ\text{C/W)}}$$

EQ 2-2

Table 2-4 • Package Thermal Resistivities

Package Type	Device	Pin Count	θ_{jc}	θ_{ja}			Units
				Still Air	200 ft./min.	500 ft./min.	
Ceramic Column Grid Array (CCGA)	RT3PE600L	484	TBD	TBD	TBD	TBD	C/W

Calculating Power Dissipation

Quiescent Supply Current

Table 2-6 • Quiescent Supply Current (I_{DD}) Characteristics When Using Flash*Freeze Mode in RT ProASIC3*

	Core Voltage	RT3PE600L	RT3PE3000L	Units
Typical (25°C)	1.2 V		2.75	mA
	1.5 V			mA

* I_{DD} includes V_{CC} , V_{PUMP} , V_{CCI} , V_{JTAG} , and V_{CCPLL} currents. Values do not include I/O static contribution (P_{DC6} and P_{DC7}).

Table 2-7 • Quiescent Supply Current (I_{DD}) Characteristics, RT ProASIC3 Sleep Mode ($V_{CC} = 0$ V)*

	Core Voltage	RT3PE600L	RT3PE3000L	Units
$V_{CCI} / V_{JTAG} = 1.2$ V (per bank) Typical (25°C)	1.2 V / 1.5 V	1.7	1.7	μ A
$V_{CCI} / V_{JTAG} = 1.5$ V (per bank) Typical (25°C)	1.2 V / 1.5 V	1.8	1.8	μ A
$V_{CCI} / V_{JTAG} = 1.8$ V (per bank) Typical (25°C)	1.2 V / 1.5 V	1.9	1.9	μ A
$V_{CCI} / V_{JTAG} = 2.5$ V (per bank) Typical (25°C)	1.2 V / 1.5 V	2.2	2.2	μ A
$V_{CCI} / V_{JTAG} = 3.3$ V (per bank) Typical (25°C)	1.2 V / 1.5 V	2.5	2.5	μ A

* I_{DD} includes V_{CC} , V_{PUMP} , and V_{CCPLL} currents. Values do not include I/O static contribution (P_{DC6} and P_{DC7}).

Table 2-8 • Quiescent Supply Current (I_{DD}) Characteristics Shutdown Mode, (V_{CC} and $V_{CCI} = 0$ V)*

	Core Voltage	RT3PE600L	RT3PE3000L
Typical (25°C)	1.2 V / 1.5 V	0 μ A	

* I_{DD} includes V_{CC} , V_{PUMP} , V_{CCI} , V_{JTAG} , and V_{CCPLL} currents. Values do not include I/O static contribution (P_{DC6} and P_{DC7}).

Table 2-9 • Quiescent Supply Current (I_{DD}), RT ProASIC3 Flash*Freeze Mode¹

	Core Voltage	RT3PE600L	RT3PE3000L	Units
I_{CCA} Current²				
Typical (25°C)	1.2 V		2.75	mA
	1.5 V			mA
I_{CCI} or I_{JTAG} Current^{3, 4}				
$V_{CCI} / V_{JTAG} = 1.2$ V (per bank) Typical (25°C)	1.2 V / 1.5 V	1.7	1.7	μ A
$V_{CCI} / V_{JTAG} = 1.5$ V (per bank) Typical (25°C)	1.2 V / 1.5 V	1.8	1.8	μ A
$V_{CCI} / V_{JTAG} = 1.8$ V (per bank) Typical (25°C)	1.2 V / 1.5 V	1.9	1.9	μ A
$V_{CCI} / V_{JTAG} = 2.5$ V (per bank) Typical (25°C)	1.2 V / 1.5 V	2.2	2.2	μ A
$V_{CCI} / V_{JTAG} = 3.3$ V (per bank) Typical (25°C)	1.2 V / 1.5 V	2.5	2.5	μ A

Notes:

1. To calculate total device I_{DD} , multiply the number of banks used by I_{CCI} and add I_{CCA} contribution.
2. Includes V_{CC} , V_{CCPLL} , and V_{PUMP} currents.
3. Per V_{CCI} or V_{JTAG} bank.
4. Values do not include I/O static contribution (P_{DC6} and P_{DC7}).

Power per I/O Pin

* For a different output load, drive strength, or slew rate, Actel recommends using the Actel power spreadsheet calculator or SmartPower tool in Libero[®] Integrated Design Environment (IDE).

Power Calculation Methodology

This section describes a simplified method to estimate power consumption of an application. For more accurate and detailed power estimations, use the SmartPower tool in Actel Libero IDE software.

The power calculation methodology described below uses the following variables:

- The number of PLLs as well as the number and the frequency of each output clock generated
- The number of combinatorial and sequential cells used in the design
- The internal clock frequencies
- The number and the standard of I/O pins used in the design
- The number of RAM blocks used in the design
- Toggle rates of I/O pins as well as VersaTiles—guidelines are provided in [Table 2-15 on page 2-17](#).
- Enable rates of output buffers—guidelines are provided for typical applications in [Table 2-16 on page 2-17](#).
- Read rate and write rate to the memory—guidelines are provided for typical applications in [Table 2-16 on page 2-17](#). The calculation should be repeated for each clock domain defined in the design.

Methodology

Total Power Consumption— P_{TOTAL}

$$P_{TOTAL} = P_{STAT} + P_{DYN}$$

P_{STAT} is the total static power consumption.

P_{DYN} is the total dynamic power consumption.

Total Static Power Consumption— P_{STAT}

$$P_{STAT} = (P_{DC1} \text{ or } P_{DC2} \text{ or } P_{DC3}) + N_{BANKS} * P_{DC5} + N_{INPUTS} * P_{DC6} + N_{OUTPUTS} * P_{DC7}$$

N_{INPUTS} is the number of I/O input buffers used in the design.

$N_{OUTPUTS}$ is the number of I/O output buffers used in the design.

N_{BANKS} is the number of I/O banks powered in the design.

Total Dynamic Power Consumption— P_{DYN}

$$P_{DYN} = P_{CLOCK} + P_{S-CELL} + P_{C-CELL} + P_{NET} + P_{INPUTS} + P_{OUTPUTS} + P_{MEMORY} + P_{PLL}$$

Global Clock Contribution— P_{CLOCK}

$$P_{CLOCK} = (P_{AC1} + N_{SPINE} * P_{AC2} + N_{ROW} * P_{AC3} + N_{S-CELL} * P_{AC4}) * F_{CLK}$$

N_{SPINE} is the number of global spines used in the user design—guidelines are provided in [Table 2-15 on page 2-17](#).

N_{ROW} is the number of VersaTile rows used in the design—guidelines are provided in [Table 2-15 on page 2-17](#).

F_{CLK} is the global clock signal frequency.

N_{S-CELL} is the number of VersaTiles used as sequential modules in the design.

P_{AC1} , P_{AC2} , P_{AC3} , and P_{AC4} are device-dependent.

Sequential Cells Contribution— P_{S-CELL}

$$P_{S-CELL} = N_{S-CELL} * (P_{AC5} + \alpha_1 / 2 * P_{AC6}) * F_{CLK}$$

N_{S-CELL} is the number of VersaTiles used as sequential modules in the design. When a multi-tile sequential cell is used, it should be accounted for as 1.

α_1 is the toggle rate of VersaTile outputs—guidelines are provided in [Table 2-15 on page 2-17](#).

F_{CLK} is the global clock signal frequency.

Combinatorial Cells Contribution— P_{C-CELL}

$$P_{C-CELL} = N_{C-CELL} * \alpha_1 / 2 * P_{AC7} * F_{CLK}$$

N_{C-CELL} is the number of VersaTiles used as combinatorial modules in the design.

α_1 is the toggle rate of VersaTile outputs—guidelines are provided in [Table 2-15 on page 2-17](#).

F_{CLK} is the global clock signal frequency.

Routing Net Contribution— P_{NET}

$$P_{NET} = (N_{S-CELL} + N_{C-CELL}) * \alpha_1 / 2 * P_{AC8} * F_{CLK}$$

N_{S-CELL} is the number of VersaTiles used as sequential modules in the design.

N_{C-CELL} is the number of VersaTiles used as combinatorial modules in the design.

α_1 is the toggle rate of VersaTile outputs—guidelines are provided in [Table 2-15 on page 2-17](#).

F_{CLK} is the global clock signal frequency.

I/O Input Buffer Contribution— P_{INPUTS}

$$P_{INPUTS} = N_{INPUTS} * \alpha_2 / 2 * P_{AC9} * F_{CLK}$$

N_{INPUTS} is the number of I/O input buffers used in the design.

α_2 is the I/O buffer toggle rate—guidelines are provided in [Table 2-15 on page 2-17](#).

F_{CLK} is the global clock signal frequency.

I/O Output Buffer Contribution— $P_{OUTPUTS}$

$$P_{OUTPUTS} = N_{OUTPUTS} * \alpha_2 / 2 * \beta_1 * P_{AC10} * F_{CLK}$$

$N_{OUTPUTS}$ is the number of I/O output buffers used in the design.

α_2 is the I/O buffer toggle rate—guidelines are provided in [Table 2-15 on page 2-17](#).

β_1 is the I/O buffer enable rate—guidelines are provided in [Table 2-16 on page 2-17](#).

F_{CLK} is the global clock signal frequency.

RAM Contribution— P_{MEMORY}

$$P_{MEMORY} = P_{AC11} * N_{BLOCKS} * F_{READ-CLOCK} * \beta_2 + P_{AC12} * N_{BLOCK} * F_{WRITE-CLOCK} * \beta_3$$

N_{BLOCKS} is the number of RAM blocks used in the design.

$F_{READ-CLOCK}$ is the memory read clock frequency.

β_2 is the RAM enable rate for read operations.

$F_{WRITE-CLOCK}$ is the memory write clock frequency.

β_3 is the RAM enable rate for write operations—guidelines are provided in [Table 2-16 on page 2-17](#).

PLL Contribution— P_{PLL}

$$P_{PLL} = P_{DC4} + P_{AC13} * F_{CLKOUT}$$

F_{CLKOUT} is the output clock frequency.¹

1. If a PLL is used to generate more than one output clock, include each output clock in the formula by adding its corresponding contribution ($P_{AC13} * F_{CLKOUT}$ product) to the total PLL contribution.

Guidelines

Toggle Rate Definition

A toggle rate defines the frequency of a net or logic element relative to a clock. It is a percentage. If the toggle rate of a net is 100%, this means that this net switches at half the clock frequency. Below are some examples:

- The average toggle rate of a shift register is 100% because all flip-flop outputs toggle at half of the clock frequency.
- The average toggle rate of an 8-bit counter is 25%:
 - Bit 0 (LSB) = 100%
 - Bit 1 = 50%
 - Bit 2 = 25%
 - ...
 - Bit 7 (MSB) = 0.78125%
 - Average toggle rate = $(100\% + 50\% + 25\% + 12.5\% + \dots + 0.78125\%) / 8$

Enable Rate Definition

Output enable rate is the average percentage of time during which tristate outputs are enabled. When nontristate output buffers are used, the enable rate should be 100%.

Table 2-15 • Toggle Rate Guidelines Recommended for Power Calculation

Component	Definition	Guideline
α_1	Toggle rate of VersaTile outputs	10%
α_2	I/O buffer toggle rate	10%

Table 2-16 • Enable Rate Guidelines Recommended for Power Calculation

Component	Definition	Guideline
β_1	I/O output buffer enable rate	100%
β_2	RAM enable rate for read operations	12.5%
β_3	RAM enable rate for write operations	12.5%

Notes:

1. Currents are measured at 125°C junction temperature.
2. Output drive strength is below JEDEC specification.
3. Output slew rate can be extracted using the IBIS Models.

Table 2-18 • Summary of Maximum and Minimum DC Input Levels

SSTL3 (II)	21 mA	103	109

 * $T_J = 100^\circ\text{C}$

Table 2-27 • Schmitt Trigger Input Hysteresis, Hysteresis Voltage Value (typical) for Schmitt Mode Input Buffers Applicable

Input Buffer Configuration	Hysteresis Value (typical)
3.3 V LVTTTL/LVCMOS/PCI/PCI-X (Schmitt trigger mode)	240 mV
2.5 V LVCMOS (Schmitt trigger mode)	140 mV
1.8 V LVCMOS (Schmitt trigger mode)	80 mV
1.5 V LVCMOS (Schmitt trigger mode)	60 mV
1.2 V LVCMOS (Schmitt trigger mode)	40 mV

The length of time an I/O can withstand I_{OSH}/I_{OSL} events depends on the junction temperature. The reliability data below is based on a 3.3 V, 12 mA I/O setting, which is the worst case for this type of analysis.

For example, at 110°C, the short current condition would have to be sustained for more than three months to cause a reliability concern. The I/O design does not contain any short circuit protection, but such protection would only be needed in extremely prolonged stress conditions.

Table 2-28 • Duration of Short Circuit Event before Failure

Temperature	Time before Failure
-40°C	> 20 years
0°C	> 20 years
25°C	> 20 years
70°C	5 years
85°C	2 years
100°C	6 months
110°C	3 months
125°C	1 month

Table 2-29 • I/O Input Rise Time, Fall Time, and Related I/O Reliability

Input Buffer	Input Rise/Fall Time (min.)	Input Rise/Fall Time (max.)	Reliability
LVTTTL/LVCMOS	No requirement	10 ns *	20 years (110°C)
LVDS/B-LVDS/ M-LVDS/LVPECL	No requirement	10 ns *	10 years (100°C)

* The maximum input risefall time is related to the noise induced in the input buffer trace. If the noise is low, the rise time and fall time of input buffers can be increased beyond the maximum value. The longer the risefall times, the more susceptible the input signal is to the board noise. Actel recommends signal integrity evaluation/characterization of the system to ensure that there is no excessive noise coupling into input signals.

Single-Ended I/O Characteristics

3.3 V LVTTTL / 3.3 V LVCMOS

Low-Voltage Transistor–Transistor Logic (LVTTTL) is a general-purpose standard (EIA/JESD) for 3.3 V applications. It uses an LVTTTL input buffer and push-pull output buffer.

Table 2-30 • Minimum and Maximum DC Input and Output Levels

3.3 V LVTTTL / 3.3 V LVCMOS	V_{IL}		V_{IH}		V_{OL}	V_{OH}	I_{OL}	I_{OH}	I_{OSL}	I_{OSH}	I_{IL}	I_{IH}
	Min., V	Max., V	Min., V	Max., V	Max., V	Min., V	mA	mA	Max., mA ¹	Max., mA ¹	μA^2	μA^2
4 mA	-0.3	0.8	2	3.6	0.4	2.4	4	4	25	27	15	15
8 mA	-0.3	0.8	2	3.6	0.4	2.4	8	8	51	54	15	15

1.5 V LVCMOS (JESD8-11)

Low-Voltage CMOS for 1.5 V is an extension of the LVCMOS standard (JESD8-5) used for general-purpose 1.5 V applications. It uses a 1.5 V input buffer and a push-pull output buffer.

Table 2-48 • Minimum and Maximum DC Input and Output Levels

1.5 V LVCMOS	V _{IL}		V _{IH}		V _{OL}	V _{OH}	I _{OL}	I _{OH}	I _{OSL}	I _{OSH}	I _{IL}	I _{IH}

Differential I/O Characteristics

Physical Implementation

Configuration of the I/O modules as a differential pair is handled by Actel Designer software when the user instantiates a differential I/O macro in the design.

Differential I/Os can also be used in conjunction with the embedded Input Register (InReg), Output Register (OutReg), Enable Register (EnReg), and Double Data Rate (DDR). However, there is no support for bidirectional I/Os or tristates with the LVPECL standards.

LVDS

Low-Voltage Differential Signaling (ANSI/TIA/EIA-644) is a high-speed, differential I/O standard. It requires that one data bit be carried through two signal lines, so two pins are needed. It also requires external resistor termination.

The full implementation of the LVDS transmitter and receiver is shown in an example in [Figure 2-24](#). The building blocks of the LVDS transmitter-receiver are one transmitter macro, one receiver macro, three board resistors at the transmitter end, and one resistor at the receiver end. The values for the three driver resistors are different from those used in the LVPECL implementation because the output standard specifications are different.

Along with LVDS I/O, military ProASIC3 also supports Bus LVDS structure and Multipoint LVDS (M-LVDS) configuration (up to 40 nodes).

Figure 2-24 • LVDS Circuit Diagram and Board-Level Implementation

Table 2-102 • Minimum and Maximum DC Input and Output Levels

DC Parameter	Description	Min.	Typ.	Max.	Units
V_{CCI}	Supply Voltage	2.375	2.5	2.625	V
V_{OL}	Output Low Voltage	0.9	1.075	1.25	V
V_{OH}	Output High Voltage	1.25	1.425	1.6	V
I_{OL}^4	Output Lower Current	0.65	0.91	1.16	mA
I_{OH}^4	Output High Current	0.65	0.91	1.16	mA
V_I	Input Voltage	0		2.925	V
I_{IH}^3	Input High Leakage Current			10	μ A
I_{IL}^3	Input Low Leakage Current			10	μ A
V_{ODIFF}	Differential Output Voltage	250	350	450	mV
V_{OCM}	Output Common Mode Voltage	1.125	1.25	1.375	V
V_{ICM}	Input Common Mode Voltage	0.05	1.25	2.35	V
V_{IDIFF}	Input Differential Voltage	100	350		mV

Notes:

1. $\pm 5\%$
2. Differential input voltage = ± 350 mV.
3. Currents are measured at 125°C junction temperature.
4. I_{OL}/I_{OH} is defined by $V_{ODIFF}/(\text{Resistor Network})$.

B-LVDS/M-LVDS

Bus LVDS (B-LVDS) and Multipoint LVDS (M-LVDS) specifications extend the existing LVDS standard to high-performance multipoint bus applications. Multidrop and multipoint bus configurations may contain any combination of drivers, receivers, and transceivers. Actel LVDS drivers provide the higher drive current required by B-LVDS and M-LVDS to accommodate the loading. The drivers require series terminations for better signal quality and to control voltage swing. Termination is also required at both ends of the bus since the driver can be located anywhere on the bus. These configurations can be implemented using the TRIBUF_LVDS and BIBUF_LVDS macros along with appropriate terminations. Multipoint designs using Actel LVDS macros can achieve up to 200 MHz with a maximum of 20 loads. A sample application is given in Figure 2-25. The input and output buffer delays are available in the LVDS section in Table 2-102 on page 2-56.

Example: For a bus consisting of 20 equidistant loads, the following terminations provide the required differential voltage, in worst-case Industrial operating conditions, at the farthest receiver: $R_S = 60 \Omega$ and $R_T = 70 \Omega$, given $Z_0 = 50 \Omega$ (2") and $Z_{stubs} = 50 \Omega$ (~1.5").

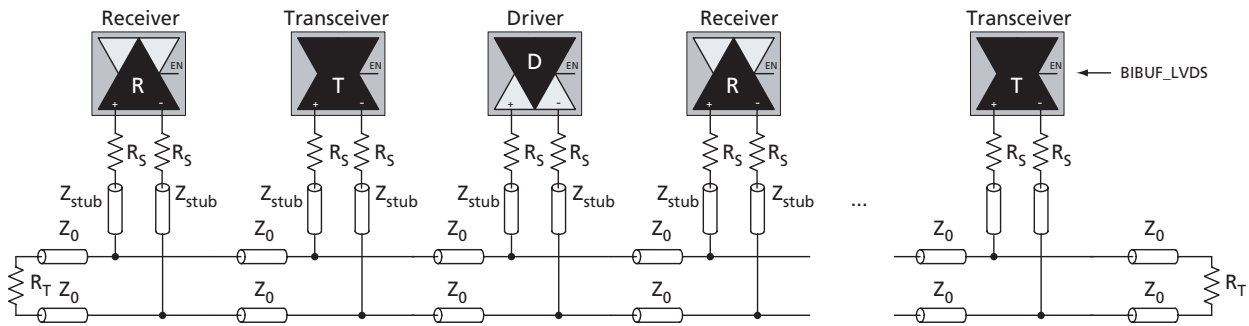

Figure 2-25 • B-LVDS/M-LVDS Multipoint Application Using LVDS I/O Buffers

LVPECL

Low-Voltage Positive Emitter-Coupled Logic (LVPECL) is another differential I/O standard. It requires that one data bit be carried through two signal lines. Like LVDS, two pins are needed. It also requires external resistor termination.

The full implementation of the LVDS transmitter and receiver is shown in an example in [Figure 2-26](#). The building blocks of the LVPECL transmitter-receiver are one transmitter macro, one receiver macro, three board resistors at the transmitter end, and one resistor at the receiver end. The values for the three driver resistors are different from those used in the LVDS implementation because the output standard specifications are different.

Figure 2-26 • LVPECL Circuit Diagram and Board-Level Implementation

Table 2-106 • Minimum and Maximum DC Input and Output Levels

DC Parameter	Description	Min.	Max.	Min.	Max.	Min.	Max.	Units

Timing Characteristics

Table 2-124 • Combinatorial Cell Propagation Delays
 Military-Case Conditions: $T_J = 125^\circ\text{C}$, Worst-Case $V_{CC} = 1.14\text{ V}$

Combinatorial Cell	Equation	Parameter	-1	Std.	Units
INV	$Y = !A$	t_{PD}	0.56	0.65	ns
AND2	$Y = A \cdot B$	t_{PD}	0.65	0.77	ns
NAND2	$Y = !(A \cdot B)$	t_{PD}	0.65	0.77	ns
OR2	$Y = A + B$	t_{PD}	0.67	0.79	ns
NOR2	$Y = !(A + B)$	t_{PD}	0.67	0.79	ns
XOR2	$Y = A \oplus B$	t_{PD}	1.02	1.20	ns
MAJ3	$Y = \text{MAJ}(A, B, C)$	t_{PD}	0.97	1.14	ns
XOR3	$Y = A \oplus B \oplus C$	t_{PD}	1.21	1.42	ns
MUX2	$Y = A \text{ IS } + B \text{ S}$	t_{PD}	0.70	0.82	ns
AND3	$Y = A \cdot B \cdot C$	t_{PD}	0.78	0.91	ns

Note: For specific junction temperature and voltage supply levels, refer to [Table 2-5 on page 2-8](#) for derating values.

Table 2-125 • Combinatorial Cell Propagation Delays
 Military-Case Conditions: $T_J = 125^\circ\text{C}$, $V_{CC} = 1.425\text{ V}$

Combinatorial Cell	Equation	Parameter	-1	Std.	Units
INV	$Y = !A$	t_{PD}	0.43	0.50	ns
AND2	$Y = A \cdot B$	t_{PD}	0.50	0.59	ns
NAND2	$Y = !(A \cdot B)$	t_{PD}	0.50	0.59	ns
OR2	$Y = A + B$	t_{PD}	0.51	0.61	ns
NOR2	$Y = !(A + B)$	t_{PD}	0.51	0.61	ns
XOR2	$Y = A \oplus B$	t_{PD}	0.78	0.92	ns
MAJ3	$Y = \text{MAJ}(A, B, C)$	t_{PD}	0.74	0.87	ns
XOR3	$Y = A \oplus B \oplus C$	t_{PD}	0.93	1.09	ns
MUX2	$Y = A \text{ IS } + B \text{ S}$	t_{PD}	0.54	0.63	ns
AND3	$Y = A \cdot B \cdot C$	t_{PD}	0.59	0.70	ns

Note: For specific junction temperature and voltage supply levels, refer to [Table 2-5 on page 2-8](#) for derating values.

VersaTile Specifications as a Sequential Module

The RT ProASIC3 library offers a wide variety of sequential cells, including flip-flops and latches. Each has a data input and optional enable, clear, or preset. In this section, timing characteristics are presented for a representative sample from the library. For more details, refer to the *IGLOO, Fusion, and ProASIC3 Macro Library Guide*.

Note: For specific junction temperature and voltage supply levels, refer to [Table 2-5 on page 2-8](#) for derating values.

Global Resource Characteristics

RT3PE600L Clock Tree Topology

Clock delays are device-specific. Figure 2-40 is an example of a global tree used for clock routing. The global tree presented in Figure 2-40 is driven by a CCC located on the west side of the RT3PE600L device. It is used to drive all D-flip-flops in the device.

Figure 2-40 • Example of Global Tree Use in an RT3PE600L Device for Clock Routing

Global Tree Timing Characteristics

Global clock delays include the central rib delay, the spine delay, and the row delay. Delays do not include I/O input buffer clock delays, as these are I/O standard-dependent, and the clock may be driven and conditioned internally by the CCC module. For more details on clock conditioning capabilities, refer to the "Clock Conditioning Circuits" section on page 2-87. Table 2-128 to Table 2-131 on page 2-86 present minimum and maximum global clock delays within each device. Minimum and maximum delays are measured with minimum and maximum loading.

Timing Characteristics

1.2 V DC Core Voltage

Table 2-128 • RT3PE600L Global Resource
Military-Case Conditions: $T_J = 125^\circ\text{C}$, $V_{CC} = 1.14\text{ V}$

Parameter	Description	-1		Std.		Units
		Min. ¹	Max. ²	Min. ¹	Max. ²	
t_{RCKL}	Input LOW Delay for Global Clock					ns
t_{RCKH}	Input HIGH Delay for Global Clock					ns
$t_{RCKMPWH}$	Minimum Pulse Width HIGH for Global Clock					ns
$t_{RCKMPWL}$	Minimum Pulse Width LOW for Global Clock					ns
t_{RCKSW}	Maximum Skew for Global Clock					ns
F_{RMAX}	Maximum Frequency for Global Clock					MHz

Notes:

1. Value reflects minimum load. The delay is measured from the CCC output to the clock pin of a sequential element, located in a lightly loaded row (single element is connected to the global net).
2. Value reflects maximum load. The delay is measured on the clock pin of the farthest sequential element, located in a fully loaded row (all available flip-flops are connected to the global net in the row).
3. For specific junction temperature and voltage supply levels, refer to Table 2-5 on page 2-8 for derating values.

Table 2-129 • RT3PE3000L Global Resource
Military-Case Conditions: $T_J = 125^\circ\text{C}$, $V_{CC} = 1.14\text{ V}$

Parameter	Description	-1		Std.		Units
		Min. ¹	Max. ²	Min. ¹	Max. ²	
t_{RCKL}	Input LOW Delay for Global Clock	1.80	2.06	2.12	2.42	ns

Clock Conditioning Circuits

CCC Electrical Specifications

Timing Characteristics

**Table 2-132 • RT ProASIC3 CCC/PLL Specification
For Devices Operating at 1.2 V DC Core Voltage**

Parameter	Min.	Typ.	Max.	Units
Clock Conditioning Circuitry Input Frequency f_{IN_CCC}	1.5		250	MHz
Clock Conditioning Circuitry Output Frequency f_{OUT_CCC}	0.75		250	MHz
Delay Increments in Programmable Delay Blocks ^{1, 2}		270		ps
Number of Programmable Values in Each Programmable Delay Block			32	
Serial Clock (SCLK) for Dynamic PLL ³			100	MHz
Input Cycle-to-Cycle Jitter (peak magnitude)			1	ns
CCC Output Peak-to-Peak Period Jitter F_{CCC_OUT}	Max Peak-to-Peak Period Jitter			
	1 Global Network Used	External FB Used	3 Global Networks Used	
0.75 MHz to 24 MHz	0.50%	0.75%	0.70%	
24 MHz to 100 MHz	1.00%	1.50%	1.20%	
100 MHz to 250 MHz	2.50%	3.75%	2.75%	
Acquisition Time	LockControl = 0		300	μs
		LockControl = 1	6.0	ms
Tracking Jitter	LockControl = 0		2	ns
		LockControl = 1	1	ns
Output Duty Cycle	48.5		51.5	%
Delay Range in Block: Programmable Delay 1 ^{1, 2}	1.2		15.65	ns
Delay Range in Block: Programmable Delay 2 ^{1, 2}	0.025		15.65	ns
Delay Range in Block: Fixed Delay ^{1, 2}		3.1		ns

Notes:

1. This delay is a function of voltage and temperature. See [Table 2-5 on page 2-8](#) for deratings.
2. $T_J = 25^\circ\text{C}$, $V_{CC} = 1.2\text{ V}$
3. Maximum value obtained for a Std. speed grade device in worst-case military conditions. For specific junction temperature and voltage supply levels, refer to [Table 2-5 on page 2-8](#) for derating values.
4. Tracking jitter is defined as the variation in clock edge position of PLL outputs with reference to PLL input clock edge. Tracking jitter does not measure the variation in PLL output period, which is covered by period jitter parameter.

**Table 2-133 • RT ProASIC3 CCC/PLL Specification
For Devices Operating at 1.5 V DC Core Voltage**

Parameter	Min.	Typ.	Max.	Units
Clock Conditioning Circuitry Input Frequency f_{IN_CCC}	1.5		350	MHz
Clock Conditioning Circuitry Output Frequency f_{OUT_CCC}	0.75		350	MHz
Serial Clock (SCLK) for Dynamic PLL ⁵			110	MHz
Delay Increments in Programmable Delay Blocks ^{1, 2}		200		ps
Number of Programmable Values in Each Programmable Delay Block			32	
Input Period Jitter			1.5	ns
CCC Output Peak-to-Peak Period Jitter F_{CCC_OUT}	Max Peak-to-Peak Period Jitter			
	1 Global Network Used		3 Global Networks Used	
0.75 MHz to 24 MHz	0.50%		0.70%	
24 MHz to 100 MHz	1.00%		1.20%	
100 MHz to 250 MHz	1.75%		2.00%	
250 MHz to 350 MHz	2.50%		5.60%	
Acquisition Time				
	LockControl = 0		300	μ s
	LockControl = 1		6.0	ms
Tracking Jitter				
	LockControl = 0		1.6	ns
	LockControl = 1		0.8	ns
Output Duty Cycle	48.5		51.5	%
Delay Range in Block: Programmable Delay 1 ^{1, 2}	0.6		5.56	ns
Delay Range in Block: Programmable Delay 2 ^{1, 2}	0.025		5.56	ns
Delay Range in Block: Fixed Delay ^{1, 2}		2.2		ns

Notes:

1. This delay is a function of voltage and temperature. See [Table 2-5 on page 2-8](#) for deratings.
2. $T_J = 25^\circ\text{C}$, $V_{CC} = 1.5\text{ V}$
3. Maximum value obtained for a Std. speed grade device in worst-case military conditions. For specific junction temperature and voltage supply levels, refer to [Table 2-5 on page 2-8](#) for derating values.
4. Tracking jitter is defined as the variation in clock edge position of PLL outputs with reference to PLL input clock edge. Tracking jitter does not measure the variation in PLL output period, which is covered by period jitter parameter.
5. Maximum value obtained for a -1 speed grade device in worst-case military conditions. For specific junction temperature and voltage supply levels, refer to [Table 2-5 on page 2-8](#) for derating values.

Note: Peak-to-peak jitter measurements are defined by $T_{\text{peak-to-peak}} = T_{\text{period_max}} - T_{\text{period_min}}$.

Timing Characteristics

Table 2-140 • Embedded FlashROM Access Time
Military-Case Conditions: $T_J = 125^\circ\text{C}$, Worst-Case $V_{CC} = 1.14\text{ V}$

Parameter	Description	-1	Std.	Units
t_{SU}	Address Setup Time	0.74	0.87	ns
t_{HOLD}	Address Hold Time	0.00	0.00	ns
t_{CKQ2}	Clock to Out	22.47	26.42	ns
F_{MAX}	Maximum Clock Frequency	15	15	MHz

Note: For specific junction temperature and voltage supply levels, refer to Table 2-5 on page 2-8 for derating values.

Table 2-141 • Embedded FlashROM Access Time
Military-Case Conditions: $T_J = 125^\circ\text{C}$, $V_{CC} = 1.425\text{ V}$

Parameter	Description	-1	Std.	Units
t_{SU}	Address Setup Time	0.56	0.66	ns
t_{HOLD}	Address Hold Time	0.00	0.00	ns
t_{CKQ2}	Clock to Out	17.19	20.21	ns
F_{MAX}	Maximum Clock Frequency	15	15	MHz

Note: For specific junction temperature and voltage supply levels, refer to Table 2-5 on page 2-8 for derating values.

JTAG 1532 Characteristics

JTAG timing delays do not include JTAG I/Os. To obtain complete JTAG timing, add I/O buffer delays to the corresponding standard selected; refer to the I/O timing characteristics in the "User I/O Characteristics" section on page 2-18 for more details.

Timing Characteristics

Table 2-142 • JTAG 1532

Military-Case Conditions: $T_J = 125^\circ\text{C}$, Worst-Case $V_{CC} = 1.14\text{ V}$

Parameter	Description	-1	Std.	Units
t_{DISU}	Test Data Input Setup Time	0.80	0.94	ns
t_{DIHD}	Test Data Input Hold Time	1.60	1.88	ns
t_{TMSSU}	Test Mode Select Setup Time	0.80	0.94	ns
t_{TMDHD}	Test Mode Select Hold Time	1.60	1.88	ns
t_{TCK2Q}	Clock to Q (data out)	6.39	7.52	ns
t_{RSTB2Q}	Reset to Q (data out)	26.63	31.33	ns
F_{TCKMAX}	TCK Maximum Frequency	18.70	15.90	MHz
$t_{TRSTREM}$	ResetB Removal Time	0.48	0.56	ns
$t_{TRSTREC}$	ResetB Recovery Time	0.00	0.00	ns
$t_{TRSTMPW}$	ResetB Minimum Pulse	TBD	TBD	ns

Note: For specific junction temperature and voltage supply levels, refer to Table 2-5 on page 2-8 for derating values.

Table 2-143 • JTAG 1532

Military-Case Conditions: $T_J = 125^\circ\text{C}$, Worst-Case $V_{CC} = 1.425\text{ V}$

Parameter	Description	-1	Std.	Units
t_{DISU}	Test Data Input Setup Time	0.60	0.71	ns
t_{DIHD}	Test Data Input Hold Time	1.21	1.42	ns
t_{TMSSU}	Test Mode Select Setup Time	0.60	0.71	ns
t_{TMDHD}	Test Mode Select Hold Time	1.21	1.42	ns
t_{TCK2Q}	Clock to Q (data out)	6.04	7.10	ns
t_{RSTB2Q}	Reset to Q (data out)	24.15	28.41	ns
F_{TCKMAX}	TCK Maximum Frequency	22.00	19.00	MHz
$t_{TRSTREM}$	ResetB Removal Time	0.00	0.00	ns
$t_{TRSTREC}$	ResetB Recovery Time	0.24	0.28	ns
$t_{TRSTMPW}$	ResetB Minimum Pulse	TBD	TBD	ns

Note: For specific junction temperature and voltage supply levels, refer to Table 2-5 on page 2-8 for derating values.

Part Number and Revision Date

Part Number 51700107-002-0

Revised September 2008

Actel Safety Critical, Life Support, and High-Reliability Applications Policy

The Actel products described in this advance status datasheet may not have completed Actel's qualification process. Actel may amend or enhance products during the product introduction and qualification process, resulting in changes in device functionality or performance. It is the responsibility of each customer to ensure the fitness of any Actel product (but especially a new product) for a particular purpose, including appropriateness for safety-critical, life-support, and other high-reliability applications. Consult Actel's Terms and Conditions for specific liability exclusions relating to life-support applications. A reliability report covering all of Actel's products is available on the Actel website at http://www.actel.com/documents/ORT_Report.pdf. Actel also offers a variety of enhanced qualification and lot acceptance screening procedures. Contact your local Actel sales office for additional reliability information.

3 – Package Pin Assignments

484-Pin CCGA

Note: This is the bottom view of the package.

Note

For Package Manufacturing and Environmental information, visit the Resource Center at <http://www.actel.com/products/solutions/package/docs.aspx>.

Part Number and Revision Date

Part Number 51700107-003-0
Revised September 2008

Datasheet Categories

Categories

In order to provide the latest information to designers, some datasheets are published before data has been fully characterized. Datasheets are designated as "Product Brief," "Advance," "Preliminary," and "Production." The definition of these categories are as follows:

Product Brief

The product brief is a summarized version of a datasheet (advance or production) and contains general product information. This document gives an overview of specific device and family information.

Advance

This version contains initial estimated information based on simulation, other products, devices, or speed grades. This information can be used as estimates, but not for production. This label only applies to the DC and Switching Characteristics chapter of the datasheet and will only be used when the data has not been fully characterized.

Preliminary

The datasheet contains information based on simulation and/or initial characterization. The information is believed to be correct, but changes are possible.

Unmarked (production)

This version contains information that is considered to be final.

Export Administration Regulations (EAR)

The products described in this document are subject to the Export Administration Regulations (EAR). They could require an approved export license prior to export from the United States. An export includes release of product or disclosure of technology to a foreign national inside or outside the United States.

Actel Safety Critical, Life Support, and High-Reliability Applications Policy

The Actel products described in this advance status document may not have completed Actel's qualification process. Actel may amend or enhance products during the product introduction and qualification process, resulting in changes in device functionality or performance. It is the responsibility of each customer to ensure the fitness of any Actel product (but especially a new product) for a particular purpose, including appropriateness for safety-critical, life-support, and other high-reliability applications. Consult Actel's Terms and Conditions for specific liability exclusions relating to life-support applications. A reliability report covering all of Actel's products is available on the Actel website at http://www.actel.com/documents/ORT_Report.pdf. Actel also offers a variety of enhanced qualification and lot acceptance screening procedures. Contact your local Actel sales office for additional reliability information.
