## Monolithic Digital IC

# LB11699H — For CD-ROM Drives

# Spindle Motor Driver IC

### Overview

The LB11699H is a spindle motor driver IC for CD-ROM drives.

### Features

- Three-phase brushless motor driver

### Functions

- Current linear drive
- Voltage controlled amplifier
- The use of high side current detection means that there is no loss (or voltage drop) due to the current detection resistor.
- Built-in short-circuit braking circuit
- Built-in reverse rotation prevention circuit
- Hall sensor FG output
- Built-in start/stop function
- Built-in current limiter circuit (adjustable)
- Built-in Hall sensor power supply
- Built-in thermal shutdown circuit
- Supports 3.3V DSPs
- Maximum current rating: 2.0A

■ Any and all SANYO Semiconductor Co.,Ltd. products described or contained herein are, with regard to "standard application", intended for the use as general electronics equipment (home appliances, AV equipment, communication device, office equipment, industrial equipment etc.). The products mentioned herein shall not be intended for use for any "special application" (medical equipment whose purpose is to sustain life, aerospace instrument, nuclear control device, burning appliances, transportation machine, traffic signal system, safety equipment etc.) that shall require extremely high level of reliability and can directly threaten human lives in case of failure or malfunction of the product or may cause harm to human bodies, nor shall they grant any guarantee thereof. If you should intend to use our products for applications outside the standard applications of our customer who is considering such use and/or outside the scope of our intended standard applications, please consult with us prior to the intended use. If there is no consultation or inquiry before the intended use, our customer shall be solely responsible for the use.

■ Specifications of any and all SANYO Semiconductor Co.,Ltd. products described or contained herein stipulate the performance, characteristics, and functions of the described products in the independent state, and are not guarantees of the performance, characteristics, and functions of the described products as mounted in the customer's products or equipment. To verify symptoms and states that cannot be evaluated in an independent device, the customer should always evaluate and test devices mounted in the customer's products or equipment.

Application Example

The values of the capacitors between power supply and ground, between output and ground, and between the Hall sensor inputs vary depending on the motor used. In particular, the Hall sensor input capacitors may not be required for some motors.

Current Limiter Setting

The LB11699H current limiter set voltage is the VLMC pin voltage, and varies as shown in the figure to the left. When the VLMC pin voltage is 0V, the current limiter set voltage will be 0V and no output current will flow.

## Pin Functions

Pin No.	Pin	Pin voltage	Description	Equivalent Circuit
19	V <sub>CC2</sub>	4V to 13.6V	Power supply that provides the source side predriver voltage. Power supply that provides the constant current control amplifier voltage.	
17	V <sub>CC1</sub>	4V to 6V	Power supply that provides all voltages other than those for the output transistors, the source side predrivers, and the low-current control amplifier.	
9	RS		Reverse rotation detection Outputs a high level for forward rotation. Outputs a low level for reverse rotation.	
8	FG		One or three Hall sensor Schmitt trigger comparator synthesized output	
15	U <sub>IN1</sub>	1.2V to V <sub>CC1</sub> -1V	U phase Hall sensor input and reverse rotation detection U phase Schmitt trigger comparator input.	
16	U <sub>IN2</sub>		The logical high state indicates the state where U <sub>IN1</sub> > U <sub>IN2</sub> .	
13	V <sub>IN1</sub>		V phase Hall sensor input and reverse rotation detection V phase Schmitt trigger comparator input.	
14	V <sub>IN2</sub>		The logical high state indicates the state where V <sub>IN1</sub> > V <sub>IN2</sub> .	
11	W <sub>IN1</sub>		W phase Hall sensor input and reverse rotation detection W phase Schmitt trigger comparator input.	
12	W <sub>IN2</sub>		The logical high state indicates the state where W <sub>IN1</sub> > W <sub>IN2</sub> .	
10	VH		Provides the Hall sensor low side device voltage.	
6	S/S	0V to V <sub>CC1</sub>	All internal circuits are stopped by setting this pin to 0.7V or lower or by setting it open. Set this pin to 2.0V or higher when driving the motor.	
5	SIG GND		Ground for all systems except the output system.

Pin No.	Pin	Pin voltage	Description	Equivalent Circuit
3	FC		Control loop frequency characteristics correction  Current control system closed loop oscillations can be prevented by connecting a capacitor between this pin and ground.	
2	VCREF	0V to VCC1-1.5V	Control system reference voltage input  The control system start voltage is determined by this voltage.	
1	VC	0V to VCC1	Speed control voltage input This is a voltage controlled system in which: The motor turns in the forward direction when VC > VCREF, and The motor turns decelerates when VC < VCREF. (Since the LB11699H includes a reverse rotation prevention circuit, the motor will never turn in the reverse direction.)	
22	WOUT		W phase output	
	FRAME GND		Output transistor ground	
21	VOUT		V phase output	
20	UOUT		U phase output	
18	RF		High side output transistor collector (common to all three phases)  Connect a resistor between the RF pin and VCC3 for current detection. The LB11699H detects this voltage to operate the constant current control and current limiter functions.	
27	VLNC	0 to 1.3V	This pin determines the current limiter set voltage. The current limiter set voltage can be changed by applying a voltage to this pin.	
28	VREF		Reference voltage (1.25V typical) output
