Notes:

1. An overtemperature protection circuit shuts down the converter if the temperature at the output inductor exceeds 115°C. The unit will restart automatically when the temperature at the output inductor drops below 110°C.
2. For a 3.3V output, the input range is 4.0 to 5.5 VDC
3. No minimum load is required. Operation at no-load will not damage these units.
4. These converters require no additional external components to meet specifications. However, using external capacitors as shown in the typical connection drawing at right may lower noise in some applications.
5. Transient recovery is measured to within a 1% error band for a load step change of 25% to 100%.
6. It is recommended that a fuse be used on the input of a power supply for protection. Contact the factory for the correct rating.

Typical Connection Diagram

1. C1 and C2 are Electrolytic capacitors. C2 should have a low ESR. C3 is a ceramic capacitor.
2. When not being used, the Remote Sense pin (pin 3) should be connected to VOUT as close to the converter as possible.
3. The output voltage of the LR50xxW may be trimmed down by connecting an external resistor between the Trim Pin (pin 4) and Ground (pin 6). This resistor value (in kΩ) is given by:

$$\text{LR5003W-xx } R_{\text{TRIM}} = \frac{21.07}{(V_o - 0.7525)} - 5.11$$

$$\text{LR5012W-xx } R_{\text{TRIM}} = \frac{10.5}{(V_o - 0.7525)} - 1.0$$

RTrim values for typical output levels are:

Output Voltage	LR5003W-xx	LR5012W-xx
0.75 VDC	Open	Open
1.00 VDC	80.021 kΩ	41.424 kΩ
1.20 VDC	41.973 kΩ	22.460 kΩ
1.50 VDC	23.077 kΩ	13.050 kΩ
1.80 VDC	15.004 kΩ	9.024 kΩ
2.00 VDC	11.779 kΩ	7.416 kΩ
2.50 VDC	6.947 kΩ	5.009 kΩ
3.30 VDC	3.160 kΩ	3.122 kΩ
5.00 VDC	---	1.472 kΩ

4. The Control input (pin 11) uses TTL compatible logic as follows:

Unit	Control Pin
ON	Open or VIN
OFF	Grnd or < 0.4V
