DESCRIPTION

The *ISSI* IS61WV12816DAxx/DBxx and IS64WV12816DBxx are high-speed, 2,097,152-bit static RAMs organized as 131,072 words by 16 bits. It is fabricated using *ISSI*'s high-performance CMOS technology. This highly reliable process coupled with innovative circuit design techniques, yields high-performance and low power consumption devices.

When \overline{CE} is HIGH (deselected), the device assumes a standby mode at which the power dissipation can be reduced down with CMOS input levels.

Easy memory expansion is provided by using Chip Enable and Output Enable inputs, \overline{CE} and \overline{OE} . The active LOW Write Enable (\overline{WE}) controls both writing and reading of the memory. A data byte allows Upper Byte (\overline{UB}) and Lower Byte (\overline{LB}) access.

The IS61WV12816DAxx/DBxx and IS64WV12816DBxx are packaged in the JEDEC standard 44-pin TSOP Type II and 48-pin Mini BGA (6mm x 8mm).

1. WRITE is an internally generated signal asserted during an overlap of the LOW states on the \overline{CE} and \overline{WE} inputs and at least one of the \overline{LB} and \overline{UB} inputs being in the LOW state.

The t_{SA} , t_{HA} , t_{SD} , and t_{HD} timing is referenced to the rising or falling edge of the signal that terminates the Write.
2. Tested with \overline{OE} HIGH for a minimum of 4 ns before $\overline{WE} = \text{LOW}$ to place the I/O in a HIGH-Z state.
3. \overline{WE} may be held LOW across many address cycles and the \overline{LB} , \overline{UB} pins can be used to control the Write function.
