

LOW NOISE 300mA LDO REGULATOR

NO.EA-141-070727

OUTLINE

The RP102x Series are CMOS-based voltage regulator ICs with high output voltage accuracy, extremely low supply current, low ON-resistance, and high ripple rejection. Each of these ICs consists of a voltage reference unit, an error amplifier, a resistor-net for voltage setting, a current limit circuit and a chip enable circuit.

These ICs perform with low dropout voltage and "chip enable" function. The line transient response and load transient response of the RP102x Series are excellent, thus these ICs are very suitable for the power supply for hand-held communication equipment.

The output voltage of these ICs is fixed with high accuracy. Since the packages for these ICs are SOT-23-5, PLP1820-6, and WLCSP-4-P2, therefore high density mounting of the ICs on boards is possible.

FEATURES

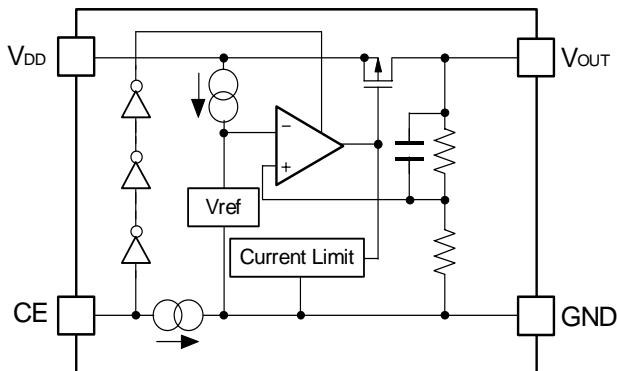

- Supply Current Typ. 50 μ A
- Standby Mode Typ. 0.1 μ A
- Dropout Voltage Typ. 0.12V ($I_{OUT}=300mA$, $V_{OUT}=2.8V$)
- Ripple Rejection Typ. 80dB (f=1kHz)
- Temperature-Drift Coefficient of Output Voltage ... Typ. $\pm 20ppm/^{\circ}C$
- Line Regulation Typ. 0.02%/V
- Output Voltage Accuracy..... $\pm 0.8\%$
- Packages WLCSP-4-P2, PLP1820-6, SOT-23-5
- Input Voltage Range 1.7V to 5.25V
- Output Voltage 1.2V, 1.25V, 1.3V, 1.5V, 1.8V, 1.85V, 2.5V, 2.6V, 2.7V, 2.8V, 2.85V, 2.9V, 3.0V, 3.3V
- Built-in Fold Back Protection Circuit Typ. 50mA (Current at short mode)
- Ceramic capacitors are recommended to be used with this IC $C_{IN}=C_{OUT}=1\mu F$ or more

APPLICATIONS

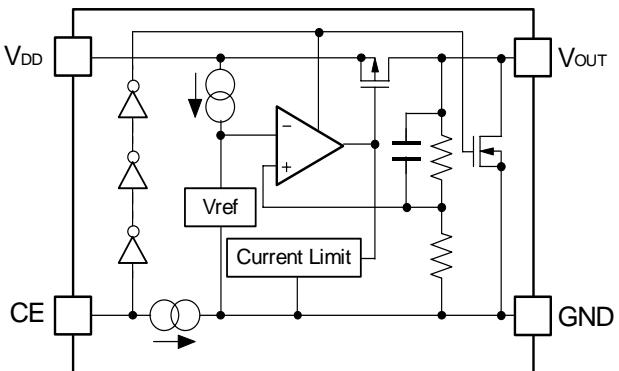

- Power source for portable communication equipment.
- Power source for electrical appliances such as cameras, VCRs and camcorders.
- Power source for battery-powered equipment.

TYPICAL APPLICATION

TECHNICAL NOTES

When using these ICs, consider the following points:

Phase Compensation

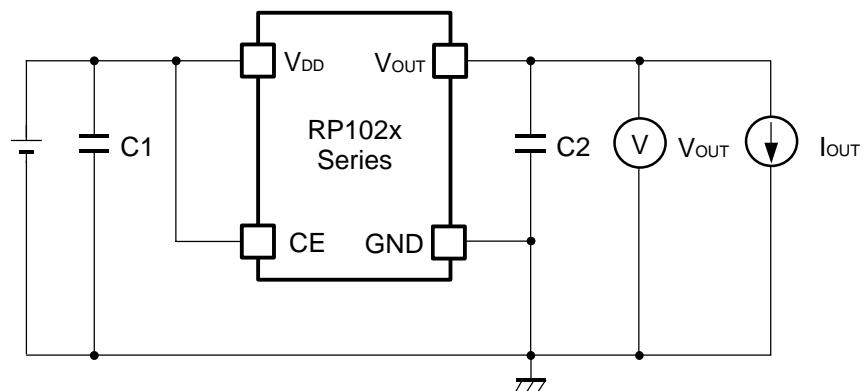

In these ICs, phase compensation is made for securing stable operation even if the load current is varied. For this purpose, use a capacitor C2 with good frequency characteristics and ESR (Equivalent Series Resistance). (Note: If additional ceramic capacitors are connected with parallel to the output pin with an output capacitor for phase compensation, the operation might be unstable. Because of this, test these ICs with as same external components as ones to be used on the PCB.)

PCB Layout

Make V_{DD} and GND lines sufficient. If their impedance is high, noise pickup or unstable operation may result. Connect a capacitor C1 with a capacitance value as much as 1.0μF or more between V_{DD} and GND pin, and as close as possible to the pins.

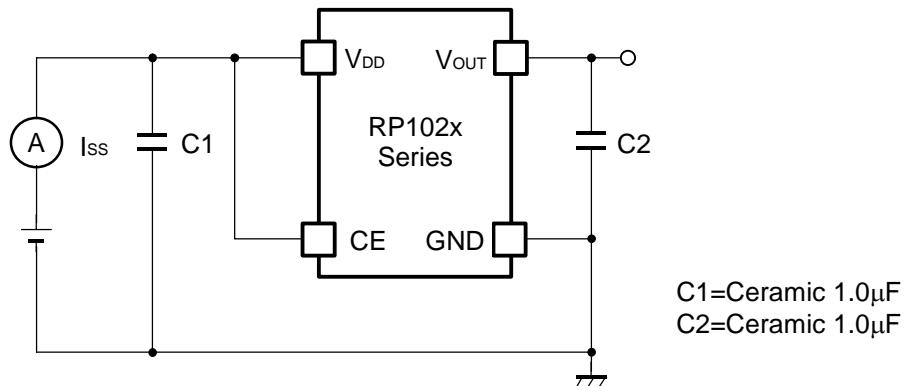

Set external components, especially the output capacitor C2, as close as possible to the ICs, and make wiring as short as possible.
