

FEATURES

- Trimmed to High Accuracy: 0.075% Max
- Low Drift: 10ppm/°C Max
- Industrial Temperature Range
- Temperature Coefficient Guaranteed to 125°C
- Low Supply Current: 130µA Max (LT1460-2.5)
- Minimum Output Current: 20mA
- No Output Capacitor Required
- Reverse Battery Protection
- Minimum Input/Output Differential: 0.9V
- Available in SO-8, MSOP-8, PDIP-8, TO-92 and SOT- 23 Package

APPLICATIONS

- Handheld Instruments
- Precision Regulators
- A/D and D/A Converters
- Power Supplies
- Hard Disk Drives

DESCRIPTION

The LT®1460 is a micropower bandgap reference that combines very high accuracy and low drift with low power dissipation and small package size. This series reference uses curvature compensation to obtain low temperature coefficient and trimmed precision thin-film resistors to achieve high output accuracy. The reference will supply up to 20mA with excellent line regulation characteristics, making it ideal for precision regulator applications.

This series reference provides supply current and power dissipation advantages over shunt references that must idle the entire load current to operate. Additionally, the LT1460 does not require an output compensation capacitor, yet is stable with capacitive loads. This feature is important where PC board space is a premium or fast settling is demanded. In the event of a reverse battery connection, these references will not conduct current, and are therefore protected from damage.

The LT1460 is available in the 8-lead MSOP, SO, PDIP and the 3-lead TO-92 and SOT23 packages.

Note 1: Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.

Note 2: If the part is stored outside of the specified temperature range, the output may shift due to hysteresis.

Note 3: Temperature coefficient is measured by dividing the change in output voltage by the specified temperature range. Incremental slope is also measured at 25°C .

Note 4: Load regulation is measured on a pulse basis from no load to the specified load current. Output changes due to die temperature change must be taken into account separately.

Note 5: Thermal regulation is caused by die temperature gradients created by load current or input voltage changes. This effect must be added to normal line or load regulation. This parameter is not 100% tested.

Note 6: Excludes load regulation errors. For LT1460S3, $\Delta V_{OUT} \leq 0.2\%$. For all other packages, $\Delta V_{OUT} \leq 0.1\%$.

Note 7: Peak-to-peak noise is measured with a single highpass filter at 0.1Hz and 2-pole lowpass filter at 10Hz. The unit is enclosed in a still-air environment to eliminate thermocouple effects on the leads. The test time is 10 sec. RMS noise is measured with a single highpass filter at 10Hz and

a 2-pole lowpass filter at 1kHz. The resulting output is full wave rectified and then integrated for a fixed period, making the final reading an average as opposed to RMS. A correction factor of 1.1 is used to convert from average to RMS and a second correction of 0.88 is used to correct for the nonideal pass band of the filters.

Note 8: Long-term stability typically has a logarithmic characteristic and therefore, changes after 1000 hours tend to be much smaller than before that time. Total drift in the second thousand hours is normally less than one third that of the first thousand hours with a continuing trend toward reduced drift with time. Significant improvement in long-term drift can be realized by preconditioning the IC with a 100 hour to 200 hour, 125°C burn-in. Long-term stability will also be affected by differential stresses between the IC and the board material created during board assembly. See PC Board Layout in the Applications Information section.

Note 9: Hysteresis in output voltage is created by package stress that differs depending on whether the IC was previously at a higher or lower temperature. Output voltage is always measured at 25°C , but the IC is cycled to 85°C or -40°C before successive measurements. Hysteresis is roughly proportional to the square of the temperature change. For instruments that are stored at reasonably well-controlled temperatures (within 20 or 30 degrees of operating temperature) hysteresis is generally not a problem.

APPLICATIONS INFORMATION

Longer Battery Life

Series references have a large advantage over older shunt style references. Shunt references require a resistor from the power supply to operate. This resistor must be chosen to supply the maximum current that can ever be demanded by the circuit being regulated. When the circuit being controlled is not operating at this maximum current, the shunt reference must always sink this current, resulting in high dissipation and short battery life.

The LT1460 series reference does not require a current setting resistor and can operate with any supply voltage from $V_{OUT} + 0.9V$ to $20V$. When the circuitry being regulated does not demand current, the LT1460 reduces its dissipation and battery life is extended. If the reference is not delivering load current it dissipates only a few mW, yet the same configuration can deliver $20mA$ of load current when demanded.

Capacitive Loads

The LT1460 is designed to be stable with capacitive loads. With no capacitive load, the reference is ideal for fast settling, applications where PC board space is a premium, or where available capacitance is limited.

The test circuit for the LT1460-2.5 shown in Figure 1 is used to measure the response time for various load currents and load capacitors. The $1V$ step from $2.5V$ to $1.5V$ produces a current step of $1mA$ or $100\mu A$ for $R_L = 1k$ or $R_L = 10k$. Figure 2 shows the response of the reference with no load capacitance.

The reference settles to $2.5mV$ (0.1%) in less than $1\mu s$ for a $100\mu A$ pulse and to 0.1% in $1.5\mu s$ with a $1mA$ step. When load capacitance is greater than $0.01\mu F$, the reference begins to ring due to the pole formed with the output impedance. Figure 3 shows the response of the reference to a $1mA$ and $100\mu A$ load current step with a $0.01\mu F$ load capacitor. The ringing can be greatly reduced with a DC load as small as $200\mu A$. With large output capacitors, \geq

$1\mu F$, the ringing can be reduced with a small resistor in series with the reference output as shown in Figure 4. Figure 5 shows the response of the LT1460-2.5 with a

Figure 1. Response Time Test Circuit

APPLICATIONS INFORMATION

$R_S = 2\Omega$ and $C_L = 1\mu F$. R_S should not be made arbitrarily large because it will limit the load regulation.

Figure 6 to Figure 8 illustrate response in the LT1460-5. The 1V step from 5V to 4V produces a current step of 1mA or 100 μA for $R_L = 1k$ or $R_L = 10k$. Figure 7 shows the response of the reference with no load capacitance.

The reference settles to 5mV (0.1%) in less than 2 μs for a 100 μA pulse and to 0.1% in 3 μs with a 1mA step. When load capacitance is greater than 0.01 μF , the reference begins to ring due to the pole formed with the output impedance. Figure 8 shows the response of the reference to a 1mA

and 100 μA load current step with a 0.01 μF load capacitor. Figure 9 to Figure 11 illustrate response of the LT1460-10. The 1V step from 10V to 9V produces a current step of 1mA or 100 μA for $R_L = 1k$ or $R_L = 10k$. Figure 10 shows the response of the reference with no load capacitance.

The reference settles to 10mV (0.1%) in 0.4 μs for a 100 μA pulse and to 0.1% in 0.8 μs with a 1mA step. When load capacitance is greater than 0.01 μF , the reference begins to ring due to the pole formed with the output impedance. Figure 11 shows the response of the reference to a 1mA and 100 μA load current step with a 0.01 μF load capacitor.

APPLICATIONS INFORMATION

Table 1 gives the maximum output capacitance for various load currents and output voltages to avoid instability. Load capacitors with low ESR (effective series resistance) cause more ringing than capacitors with higher ESR such as polarized aluminum or tantalum capacitors.

Table 1. Maximum Output Capacitance

VOLTAGE OPTION	I _{OUT} = 100μA	I _{OUT} = 1mA	I _{OUT} = 10mA	I _{OUT} = 20mA
2.5V	>10μF	>10μF	2μF	0.68μF
3V	>10μF	>10μF	2μF	0.68μF
3.3V	>10μF	>10μF	1μF	0.68μF
5V	>10μF	>10μF	1μF	0.68μF
10V	>10μF	1μF	0.15μF	0.1μF

Long-Term Drift

Long-term drift cannot be extrapolated from accelerated high temperature testing. This erroneous technique gives drift numbers that are wildly optimistic. The only way long-term drift can be determined is to measure it over the time interval of interest. The LT1460S3 long-term drift data was taken on over 100 parts that were soldered into PC boards similar to a “real world” application. The boards were then placed into a constant temperature oven with T_A = 30°C, their outputs were scanned regularly and measured with an 8.5 digit DVM. Figure 12 shows typical long-term drift of the LT1460S3s.

Figure 12. Typical Long-Term Drift

Hysteresis

Hysteresis data shown in Figure 13 and Figure 14 represents the worst-case data taken on parts from 0°C to 70°C and from -40°C to 85°C. The device is capable of dissipating relatively high power, i.e., for the LT1460S3-2.5, PD = 17.5V • 20mA = 350mW. The thermal resistance of the SOT-23 package is 325°C/W and this dissipation causes a 114°C internal rise producing a junction temperature of T_J = 25°C + 114°C = 139°C. This elevated temperature will cause the output to shift due to thermal hysteresis. **For highest performance in precision applications, do not let the LT1460S3’s junction temperature exceed 85°C.**

Figure 13. 0°C to 70°C Hysteresis

Figure 14. -40°C to 85°C Hysteresis

APPLICATIONS INFORMATION

Input Capacitance

It is recommended that a 0.1μF or larger capacitor be added to the input pin of the LT1460. This can help with stability when large load currents are demanded.

Output Accuracy

Like all references, either series or shunt, the error budget of the LT1460-2.5 is made up of primarily three components: initial accuracy, temperature coefficient and load regulation. Line regulation is neglected because it typically contributes only 30ppm/V, or 75μV for a 1V input change. The LT1460-2.5 typically shifts less than 0.01% when soldered into a PCB, so this is also neglected (see PC Board Layout section). The output errors are calculated as follows for a 100μA load and 0°C to 70°C temperature range:

LT1460AC

Initial accuracy = 0.075%

For $I_O = 100\mu\text{A}$, and using the LT1460-2.5 for calculation,

$$\Delta V_{\text{OUT}} = \left(\frac{3500\text{ppm}}{\text{mA}} \right) (0.1\text{mA})(2.5\text{V}) = 875\mu\text{V}$$

which is 0.035%.

For temperature 0°C to 70°C the maximum $\Delta T = 70^\circ\text{C}$,

$$\Delta V_{\text{OUT}} = \left(\frac{10\text{ppm}}{^\circ\text{C}} \right) (70^\circ\text{C})(2.5\text{V}) = 1.75\text{mV}$$

which is 0.07%.

Total worst-case output error is:

$$0.075\% + 0.035\% + 0.070\% = 0.180\%.$$

Table 1 gives worst-case accuracy for the LT1460AC, CC, DC, FC, GC from 0°C to 70°C and the LT1460BI, EI, GI from -40°C to 85°C.

Note that the LT1460-5 and LT1460-10 give identical accuracy as a fraction of their respective output voltages.

PC Board Layout

In 13- to 16-bit systems where initial accuracy and temperature coefficient calibrations have been done, the mechanical and thermal stress on a PC board (in a cardcage for instance) can shift the output voltage and mask the true temperature coefficient of a reference. In addition, the mechanical stress of being soldered into a PC board can cause the output voltage to shift from its ideal value. Surface mount voltage references (MS8 and S8) are the most susceptible to PC board stress because of the small amount of plastic used to hold the lead frame.

A simple way to improve the stress-related shifts is to mount the reference near the short edge of the PC board, or in a corner. The board edge acts as a stress boundary, or a region where the flexure of the board is minimum. The package should always be mounted so that the leads absorb the stress and not the package. The package is generally aligned with the leads parallel to the long side of the PC board as shown in Figure 16a.

A qualitative technique to evaluate the effect of stress on voltage references is to solder the part into a PC board and

APPLICATIONS INFORMATION

deform the board a fixed amount as shown in Figure 15. The flexure #1 represents no displacement, flexure #2 is concave movement, flexure #3 is relaxation to no displacement and finally, flexure #4 is a convex movement. This motion is repeated for a number of cycles and the relative output deviation is noted. The result shown in Figure 16a is for two LT1460S8-2.5s mounted vertically and Figure 16b is for two LT1460S8-2.5s mounted horizontally. The parts oriented in Figure 16a impart less stress into the package because stress is absorbed in the leads. Figures 16a and 16b show the deviation to be between 125 μ V and

250 μ V and implies a 50ppm and 100ppm change respectively. This corresponds to a 13- to 14-bit system and is not a problem for most 10- to 12-bit systems unless the system has a calibration. In this case, as with temperature hysteresis, this low level can be important and even more careful techniques are required.

The most effective technique to improve PC board stress is to cut slots in the board around the reference to serve as a strain relief. These slots can be cut on three sides of the reference and the leads can exit on the fourth side. This “tongue” of PC board material can be oriented in the long direction of the board to further reduce stress transferred to the reference.

The results of slotting the PC boards of Figures 16a and 16b are shown in Figures 17a and 17b. In this example the slots can improve the output shift from about 100ppm to nearly zero.

SIMPLIFIED SCHEMATIC

PACKAGE DESCRIPTION

S3 Package
3-Lead Plastic SOT-23
 (Reference LTC DWG # 05-08-1631)

- NOTE:
1. CONTROLLING DIMENSION: MILLIMETERS
 2. DIMENSIONS ARE IN MILLIMETERS (INCHES)
 3. DRAWING NOT TO SCALE
 4. DIMENSIONS ARE INCLUSIVE OF PLATING
 5. DIMENSIONS ARE EXCLUSIVE OF MOLD FLASH AND METAL BURR
 6. MOLD FLASH SHALL NOT EXCEED .254mm
 7. PACKAGE JEDEC REFERENCE IS TO-236 VARIATION AB

S3 SOT-23 0502

PACKAGE DESCRIPTION

N8 Package
8-Lead PDIP (Narrow .300 Inch)
 (Reference LTC DWG # 05-08-1510)

NOTE:
 1. DIMENSIONS ARE $\frac{\text{INCHES}}{\text{MILLIMETERS}}$
 *THESE DIMENSIONS DO NOT INCLUDE MOLD FLASH OR PROTRUSIONS.
 MOLD FLASH OR PROTRUSIONS SHALL NOT EXCEED .010 INCH (0.254mm)

S8 Package
8-Lead Plastic Small Outline (Narrow .150 Inch)
 (Reference LTC DWG # 05-08-1610)

RECOMMENDED SOLDER PAD LAYOUT

NOTE:
 1. DIMENSIONS IN $\frac{\text{INCHES}}{\text{MILLIMETERS}}$
 2. DRAWING NOT TO SCALE
 3. THESE DIMENSIONS DO NOT INCLUDE MOLD FLASH OR PROTRUSIONS.
 MOLD FLASH OR PROTRUSIONS SHALL NOT EXCEED .006" (0.15mm)

S08 0303

PACKAGE DESCRIPTION

MS8 Package 8-Lead Plastic MSOP (Reference LTC DWG # 05-08-1660)

- NOTE:
1. DIMENSIONS IN MILLIMETER/(INCH)
 2. DRAWING NOT TO SCALE
 3. DIMENSION DOES NOT INCLUDE MOLD FLASH, PROTRUSIONS OR GATE BURRS.
MOLD FLASH, PROTRUSIONS OR GATE BURRS SHALL NOT EXCEED 0.152mm (.006") PER SIDE
 4. DIMENSION DOES NOT INCLUDE INTERLEAD FLASH OR PROTRUSIONS.
INTERLEAD FLASH OR PROTRUSIONS SHALL NOT EXCEED 0.152mm (.006") PER SIDE
 5. LEAD COPLANARITY (BOTTOM OF LEADS AFTER FORMING) SHALL BE 0.102mm (.004") MAX

Z Package 3-Lead Plastic TO-92 (Similar to TO-226) (Reference LTC DWG # 05-08-1410)

TYPICAL APPLICATIONS

Handling Higher Load Currents

*SELECT R1 TO DELIVER 80% OF TYPICAL LOAD CURRENT. LT1460 WILL THEN SOURCE AS NECESSARY TO MAINTAIN PROPER OUTPUT. DO NOT REMOVE LOAD AS OUTPUT WILL BE DRIVEN UNREGULATED HIGH. LINE REGULATION IS DEGRADED IN THIS APPLICATION

$$R1 = \frac{V^+ - V_{OUT}}{40mA}$$

1460 TA03

Boosted Output Current with No Current Limit

1460 TA04

Boosted Output Current with Current Limit

* GLOWS IN CURRENT LIMIT, DO NOT OMIT
