

12-Bit Parity Generator/Checker

The MC10E100E160 is a 12-bit parity generator/checker. The Q output is HIGH when an odd number of inputs are HIGH. A HIGH on the Enable input (EN) forces the Q output LOW.

The E160 also features an output register. Multiplexers direct the register input, giving the option of holding present data by asserting HOLD LOW, or of shifting data in through the S-IN pin by asserting SHIFT HIGH. The output register itself is clocked by a positive edge on CLK1 or CLK2 (or both). A HIGH on the reset pin (R) overrides to force the Y output LOW.

- Provides Odd-HIGH Parity of 12 Inputs
- Shiftable Output Register with Hold
- 900ps Max. D to Q/Q Output
- Enable
- Asynchronous Register Reset
- Dual Clocks
- Extended 100E V_{EE} Range of - 4.2V to - 5.46V
- 75kΩ Input Pulldown Resistors

Pinout: 28-Lead PLCC (Top View)

* All VCC and VCC0 pins are tied together on the die.
