

# 16 Mbit Concurrent SuperFlash

## SST36VF1601

Data Sheet

### FEATURES:

- **Organized as 1M x16**
- **Dual Bank Architecture for Concurrent Read/Write Operation**
  - 16 Mbit Bottom Sector Protection
    - SST36VF1601: 12 Mbit + 4 Mbit
- **Single 2.7-3.6V for Read and Write Operations**
- **Superior Reliability**
  - Endurance: 100,000 cycles (typical)
  - Greater than 100 years Data Retention
- **Low Power Consumption:**
  - Active Current: 25 mA
  - Standby Current: 4  $\mu$ A
- **Hardware Sector Protection/WP# Input Pin**
  - Protects 4 outermost sectors (4 KWord) in the larger bank by driving WP# low and unprotects by driving WP# high
- **Hardware Reset Pin (RST#)**
  - Resets the internal state machine to reading array data
- **Sector-Erase Capability**
  - Uniform 1 KWord sectors
- **Block-Erase Capability**
  - Uniform 32 KWord blocks
- **Fast Read Access Time**
  - 70 ns
- **Latched Address and Data**
- **Fast Erase and Word-Program (typical):**
  - Sector-Erase Time: 18 ms
  - Block-Erase Time: 18 ms
  - Chip-Erase Time: 70 ms
  - Word-Program Time: 14  $\mu$ s
  - Chip Rewrite Time: 8 seconds
- **Automatic Write Timing**
  - Internal V<sub>PP</sub> Generation
- **End-of-Write Detection**
  - Toggle Bit
  - Data# Polling
  - Ready/Busy# pin
- **CMOS I/O Compatibility**
- **Conforms to Common Flash Memory Interface (CFI)**
- **JEDEC Standards**
  - Flash EEPROM Pinouts and command sets
- **Packages Available**
  - 48-lead TSOP (12mm x 20mm)
  - 48-ball TFBGA (8mm x 10mm)

### PRODUCT DESCRIPTION

The SST36VF1601 is 1M x16 CMOS Concurrent Read/Write Flash Memory manufactured with SST's proprietary, high performance CMOS SuperFlash technology. The split-gate cell design and thick oxide tunneling injector attain better reliability and manufacturability compared with alternate approaches. The SST36VF1601 writes (Program or Erase) with a 2.7-3.6V power supply. The SST36VF1601 device conforms to JEDEC standard pinouts for x16 memories.

Featuring high performance Word-Program, the SST36VF1601 device provides a typical Word-Program time of 14  $\mu$ sec. The devices use Toggle Bit or Data# Polling to detect the completion of the Program or Erase operation. To protect against inadvertent write, the SST36VF1601 device has on-chip hardware and Software Data Protection schemes. Designed, manufactured, and tested for a wide spectrum of applications, the

SST36VF1601 device is offered with a guaranteed endurance of 10,000 cycles. Data retention is rated at greater than 100 years.

The SST36VF1601 is suited for applications that require convenient and economical updating of program, configuration, or data memory. For all system applications, the SST36VF1601 significantly improves performance and reliability, while lowering power consumption. The SST36VF1601 inherently uses less energy during Erase and Program than alternative flash technologies. The total energy consumed is a function of the applied voltage, current, and time of application. Since for any given voltage range, the SuperFlash technology uses less current to program and has a shorter erase time, the total energy consumed during any Erase or Program operation is less than alternative flash technologies. The SST36VF1601 also improves flexibility while lowering the cost for program, data, and configuration storage applications.

The SuperFlash technology provides fixed Erase and Program times, independent of the number of Erase/Program cycles that have occurred. Therefore the system software or hardware does not have to be modified or de-rated as is necessary with alternative flash technologies, whose Erase and Program times increase with accumulated Erase/Program cycles.

To meet high density, surface mount requirements, the SST36VF1601 is offered in 48-lead TSOP and 48-ball TFBGA packages. See Figures 2 and 3 for pinouts.

## Device Operation

Commands are used to initiate the memory operation functions of the device. Commands are written to the device using standard microprocessor write sequences. A command is written by asserting WE# low while keeping CE# low. The address bus is latched on the falling edge of WE# or CE#, whichever occurs last. The data bus is latched on the rising edge of WE# or CE#, whichever occurs first.

## Concurrent Read/Write Operation

Dual bank architecture of SST36VF1601 device allows the Concurrent Read/Write operation whereby the user can read from one bank while program or erase in the other bank. This operation can be used when the user needs to read system code in one bank while updating data in the other bank.

### CONCURRENT READ/WRITE STATE

Bank 1	Bank 2
Read	No Operation
Read	Write
Write	Read
Write	No Operation
No Operation	Read
No Operation	Write

**Note:** For the purposes of this table, write means to perform Block-, Sector-, or Chip-Erase or Word-Program operations as applicable to the appropriate bank.

## Read Operation

The Read operation of the SST36VF1601 is controlled by CE# and OE#, both have to be low for the system to obtain data from the outputs. CE# is used for device selection. When CE# is high, the chip is deselected and only standby power is consumed. OE# is the output control and is used to gate data on the output pins.

The data bus is in high impedance state when either CE# or OE# is high. Refer to the Read cycle timing diagram for further details (Figure 4).

## Word-Program Operation

The SST36VF1601 is programmed on a word-by-word basis. Before programming, one must ensure that the sector, in which the word which is being programmed exists, is fully erased. The Program operation consists of three steps. The first step is the three-byte load sequence for Software Data Protection. The second step is to load word address and word data. During the Word-Program operation, the addresses are latched on the falling edge of either CE# or WE#, whichever occurs last. The data is latched on the rising edge of either CE# or WE#, whichever occurs first. The third step is the internal Program operation which is initiated after the rising edge of the fourth WE# or CE#, whichever occurs first. The Program operation, once initiated, will be completed typically within 10 μs. See Figures 5 and 6 for WE# and CE# controlled Program operation timing diagrams and Figure 19 for flowcharts. During the Program operation, the only valid reads are Data# Polling and Toggle Bit. During the internal Program operation, the host is free to perform additional tasks. Any commands issued during the internal Program operation are ignored.

## Sector- (Block-) Erase Operation

The Sector- (Block-) Erase operation allows the system to erase the device on a sector-by-sector (or block-by-block) basis. The SST36VF1601 offers both Sector-Erase and Block-Erase mode. The sector architecture is based on uniform sector size of 1 KWord. The Block-Erase mode is based on uniform block size of 32 KWord. The Sector-Erase operation is initiated by executing a six-byte command sequence with Sector-Erase command (30H) and sector address (SA) in the last bus cycle. The Block-Erase operation is initiated by executing a six-byte command sequence with Block-Erase command (50H) and block address (BA) in the last bus cycle. The sector or block address is latched on the falling edge of the sixth WE# pulse, while the command (30H or 50H) is latched on the rising edge of the sixth WE# pulse. The internal Erase operation begins after the sixth WE# pulse. See Figures 10 and 11 for timing waveforms. Any commands issued during the Sector- or Block-Erase operation are ignored.

## Chip-Erase Operation

The SST36VF1601 provides a Chip-Erase operation, which allows the user to erase all unprotected sectors/blocks to the “1” state. This is useful when the device must be quickly erased.

# 16 Mbit Concurrent SuperFlash

## SST36VF1601

### Data Sheet

The Chip-Erase operation is initiated by executing a six-byte command sequence with Chip-Erase command (10H) at address 5555H in the last byte sequence. The Erase operation begins with the rising edge of the sixth WE# or CE#, whichever occurs first. During the Erase operation, the only valid Read is Toggle Bit or Data# Polling. See Table 4 for the command sequence, Figure 9 for timing diagram, and Figure 22 for the flowchart. Any commands issued during the Chip-Erase operation are ignored.

### Write Operation Status Detection

The SST36VF1601 provides one hardware and two software means to detect the completion of a Write (Program or Erase) cycle, in order to optimize the system Write cycle time. The hardware detection uses the Ready/Busy# (RY/BY#) output pin. The software detection includes two status bits: Data# Polling (DQ<sub>7</sub>) and Toggle Bit (DQ<sub>6</sub>). The End-of-Write detection mode is enabled after the rising edge of WE#, which initiates the internal Program or Erase operation.

The actual completion of the nonvolatile write is asynchronous with the system; therefore, either a Ready/Busy# (RY/BY#), a Data# Polling (DQ<sub>7</sub>) or Toggle Bit (DQ<sub>6</sub>) read may be simultaneous with the completion of the Write cycle. If this occurs, the system may possibly get an erroneous result, i.e., valid data may appear to conflict with either DQ<sub>7</sub> or DQ<sub>6</sub>. In order to prevent spurious rejection, if an erroneous result occurs, the software routine should include a loop to read the accessed location an additional two (2) times. If both reads are valid, then the device has completed the Write cycle, otherwise the rejection is valid.

### Ready/Busy# (RY/BY#)

The SST36VF1601 includes a Ready/Busy# (RY/BY#) output signal. RY/BY# is actively pulled low while during an internal Erase or Program operation is in progress. RY/BY# is an open drain output that allows several devices to be tied in parallel to V<sub>DD</sub> via an external pull up resistor. RY/BY# is high impedance whenever CE# is high or RST# is low. There is a 1 μs bus recovery time (T<sub>BR</sub>) required before valid data can be read on the data bus. New commands can be entered immediately after RY/BY# goes high.

### Data# Polling (DQ<sub>7</sub>)

When the SST36VF1601 is in the internal Program operation, any attempt to read DQ<sub>7</sub> will produce the complement of the true data. Once the Program operation is completed, DQ<sub>7</sub> will produce true data. During internal Erase operation, any attempt to read DQ<sub>7</sub> will produce a '0'. Once the internal Erase operation is completed, DQ<sub>7</sub> will produce a

'1'. The Data# Polling is valid after the rising edge of fourth WE# (or CE#) pulse for Program operation. For Sector-, Block-, or Chip-Erase, the Data# Polling is valid after the rising edge of sixth WE# (or CE#) pulse. See Figure 7 for Data# Polling (DQ<sub>7</sub>) timing diagram and Figure 20 for a flowchart. There is a 1 μs bus recovery time (T<sub>BR</sub>) required before valid data can be read on the data bus. New commands can be entered immediately after DQ<sub>7</sub> becomes true data.

### Toggle Bit (DQ<sub>6</sub>)

During the internal Program or Erase operation, any consecutive attempts to read DQ<sub>6</sub> will produce alternating 1s and 0s, i.e., toggling between 1 and 0. When the internal Program or Erase operation is completed, the DQ<sub>6</sub> bit will stop toggling. The Toggle Bit is valid after the rising edge of fourth WE# (or CE#) pulse for Program operation. For Sector-, Block- or Chip-Erase, the Toggle Bit is valid after the rising edge of sixth WE# (or CE#) pulse. See Figure 8 for Toggle Bit timing diagram and Figure 20 for a flowchart. There is a 1 μs bus recovery time (T<sub>BR</sub>) required before valid data can be read on the data bus. New commands can be entered immediately after DQ<sub>6</sub> no longer toggles.

### Data Protection

The SST36VF1601 provides both hardware and software features to protect nonvolatile data from inadvertent writes.

#### Hardware Data Protection

**Noise/Glitch Protection:** A WE# or CE# pulse of less than 5 ns will not initiate a Write cycle.

**V<sub>DD</sub> Power Up/Down Detection:** The Write operation is inhibited when V<sub>DD</sub> is less than 1.5V.

**Write Inhibit Mode:** Forcing OE# low, CE# high, or WE# high will inhibit the Write operation. This prevents inadvertent writes during power-up or power-down.

#### Hardware Block Protection

The SST36VF1601 provides a hardware block protection which protects the outermost 4 KWord in the larger bank. The block is protected when WP# is held low. See Figure 1 for Block-Protection location.

A user can disable block protection by driving WP# high thus allowing erase or program of data into the protected sectors. WP# must be held high prior to issuing the write command and remain stable until after the entire Write operation has completed.

## Hardware Reset (RST#)

The RST# pin provides a hardware method of resetting the device to read array data. When the RST# pin is held low for at least  $T_{RP}$ , any in-progress operation will terminate and return to Read mode (see Figure 16). When no internal Program/Erase operation is in progress, a minimum period of  $T_{RHR}$  is required after RST# is driven high before a valid Read can take place (see Figure 15).

The Erase operation that has been interrupted needs to be reinitiated after the device resumes normal operation mode to ensure data integrity.

## Software Data Protection (SDP)

The SST36VF1601 provides the JEDEC standard Software Data Protection scheme for all data alteration operations, i.e., Program and Erase. Any Program operation requires the inclusion of the three-byte sequence. The three-byte load sequence is used to initiate the Program operation, providing optimal protection from inadvertent Write operations, e.g., during the system power-up or power-down. Any Erase operation requires the inclusion of six-byte sequence. The SST36VF1601 is shipped with the Software Data Protection permanently enabled. See Table 4 for the specific software command codes. During SDP command sequence, invalid commands will abort the device to Read mode within  $T_{RC}$ . The contents of  $DQ_{15}$ - $DQ_8$  can be  $V_{IL}$  or  $V_{IH}$ , but no other value during any SDP command sequence.

## Common Flash Memory Interface (CFI)

The SST36VF1601 also contains the CFI information to describe the characteristics of the device. In order to enter the CFI Query mode, the system must write three-byte sequence, same as Software ID Entry command with 98H (CFI Query command) to address 5555H in the last byte

sequence. Once the device enters the CFI Query mode, the system can read CFI data at the addresses given in Tables 5 through 7. The system must write the CFI Exit command to return to Read mode from the CFI Query mode.

## Product Identification

The Product Identification mode identifies the device and manufacturer. For details, see Table 4 for software operation, Figure 12 for the Software ID Entry and Read timing diagram and Figure 21 for the Software ID Entry command sequence flowchart.

TABLE 1: PRODUCT IDENTIFICATION

	Word	Data
Manufacturer's ID	0000H	00BFH
Device ID SST36VF1601	0001H	2761H

T1.1 373

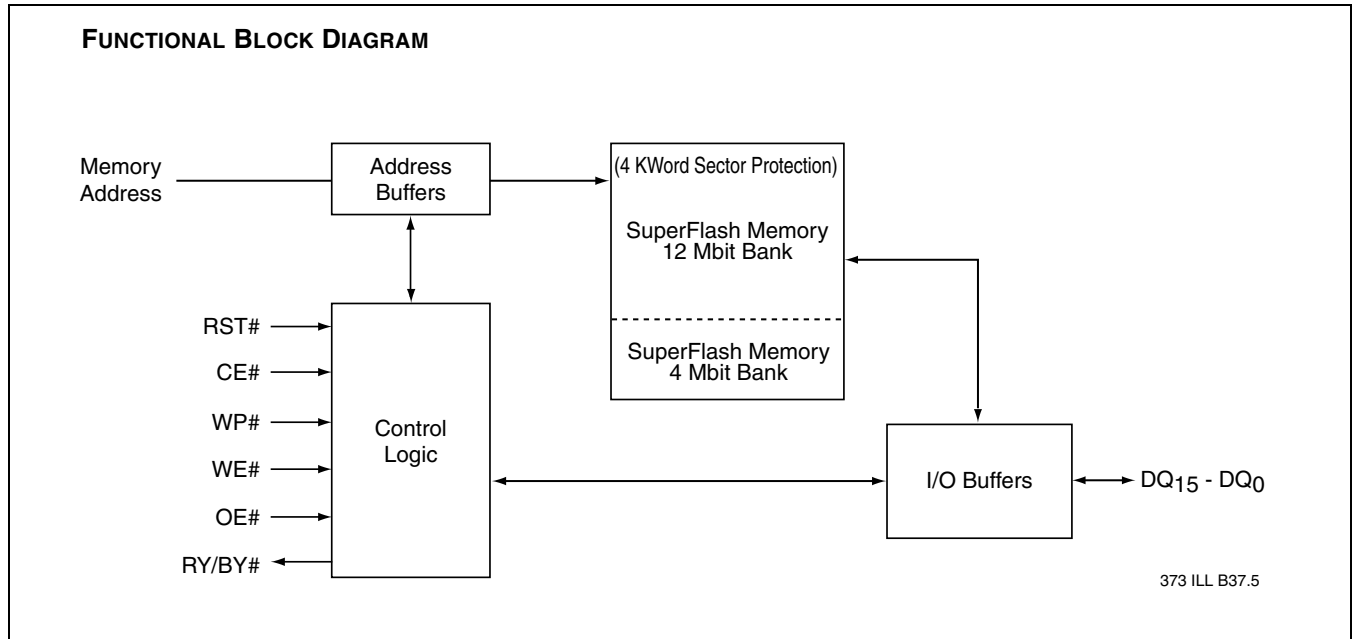

## Product Identification Mode Exit/CFI Mode Exit

In order to return to the standard Read mode, the Software Product Identification mode must be exited. Exit is accomplished by issuing the Software ID Exit command sequence, which returns the device to the Read mode. This command may also be used to reset the device to the Read mode after any inadvertent transient condition that apparently causes the device to behave abnormally, e.g., not read correctly. Please note that the Software ID Exit/CFI Exit command is ignored during an internal Program or Erase operation. See Table 4 for the software command code, Figure 14 for timing waveform and Figure 21 for a flowchart.

	Program and Erase		40	mA	
	Concurrent Read/Write		75	mA	
$I_{SB}$	Standby $V_{DD}$ Current		20	$\mu A$	CE#= $V_{IHC}$ , $V_{DD}=V_{DD}$ Max
$I_{RT}$	Reset $V_{DD}$ Current		20	$\mu A$	RST# = $V_{SS} \pm 0.3V$
$I_{LI}$	Input Leakage Current		1	$\mu A$	$V_{IN}=GND$ to $V_{DD}$ , $V_{DD}=V_{DD}$ Max
$I_{LO}$	Output Leakage Current		1	$\mu A$	$V_{OUT}=GND$ to $V_{DD}$ , $V_{DD}=V_{DD}$ Max
$V_{IL}$	Input Low Voltage		0.8	V	$V_{DD}=V_{DD}$ Min
$V_{ILC}$	Input Low Voltage (CMOS)		0.3	V	$V_{DD}=V_{DD}$ Max
$V_{IH}$	Input High Voltage	$0.7 V_{DD}$		V	$V_{DD}=V_{DD}$ Max
$V_{IHC}$	Input High Voltage (CMOS)	$V_{DD}-0.3$		V	$V_{DD}=V_{DD}$ Max
$V_{OL}$	Output Low Voltage		0.2	V	$I_{OL}=100 \mu A$ , $V_{DD}=V_{DD}$ Min
$V_{OH}$	Output High Voltage	$V_{DD}-0.2$		V	$I_{OH}=-100 \mu A$ , $V_{DD}=V_{DD}$ Min

T8.6 373

**TABLE 9: RECOMMENDED SYSTEM POWER-UP TIMINGS**

Symbol	Parameter	Minimum	Units
$T_{PU-READ}^1$	Power-up to Read Operation	100	$\mu s$
$T_{PU-WRITE}^1$	Power-up to Write Operation	100	$\mu s$

T9.2 373

1. This parameter is measured only for initial qualification and after a design or process change that could affect this parameter.

**TABLE 10: CAPACITANCE ( $T_a = 25^\circ C$ ,  $f=1$  Mhz, other pins open)**

Parameter	Description	Test Condition	Maximum
$C_{I/O}^1$	I/O Pin Capacitance	$V_{I/O} = 0V$	10 pF
$C_{IN}^1$	Input Capacitance	$V_{IN} = 0V$	10 pF

T10.0 373

1. This parameter is measured only for initial qualification and after a design or process change that could affect this parameter.

**TABLE 11: RELIABILITY CHARACTERISTICS**

Symbol	Parameter	Minimum Specification	Units	Test Method
$N_{END}^1$	Endurance	10,000	Cycles	JEDEC Standard A117
$T_{DR}^1$	Data Retention	100	Years	JEDEC Standard A103
$I_{LTH}^1$	Latch Up	$100 + I_{DD}$	mA	JEDEC Standard 78

T11.1 373

1. This parameter is measured only for initial qualification and after a design or process change that could affect this parameter.

Data Sheet

## AC CHARACTERISTICS

**TABLE 12: READ CYCLE TIMING PARAMETERS  $V_{DD} = 2.7-3.6V$**

Symbol	Parameter	SST36VF1601-70		Units
		Min	Max	
$T_{RC}$	Read Cycle Time	70		ns
$T_{CE}$	Chip Enable Access Time		70	ns
$T_{AA}$	Address Access Time		70	ns
$T_{OE}$	Output Enable Access Time		35	ns
$T_{CLZ}^1$	CE# Low to Active Output	0		ns
$T_{OLZ}^1$	OE# Low to Active Output	0		ns
$T_{CHZ}^1$	CE# High to High-Z Output		20	ns
$T_{OHZ}^1$	OE# High to High-Z Output		20	ns
$T_{OH}^1$	Output Hold from Address Change	0		ns
$T_{RP}^1$	RST# Pulse Width	500		ns
$T_{RHR}^1$	RST# High before Read	50		ns
$T_{RY}^{1,2}$	RST# Pin Low to Read Mode		150	$\mu$ s

T12.9 373

1. This parameter is measured only for initial qualification and after a design or process change that could affect this parameter.
2. This parameter applies to Sector-Erase, Block-Erase and Program operations. This parameter does not apply to Chip-Erase operations.

**TABLE 13: PROGRAM/ERASE CYCLE TIMING PARAMETERS**

Symbol	Parameter	Min	Max	Units
$T_{BP}$	Word-Program Time		20	$\mu$ s
$T_{AS}$	Address Setup Time	0		ns
$T_{AH}$	Address Hold Time	40		ns
$T_{CS}$	WE# and CE# Setup Time	0		ns
$T_{CH}$	WE# and CE# Hold Time	0		ns
$T_{OES}$	OE# High Setup Time	0		ns
$T_{OEH}$	OE# High Hold Time	10		ns
$T_{CP}$	CE# Pulse Width	40		ns
$T_{WP}$	WE# Pulse Width	40		ns
$T_{WPH}^1$	WE# Pulse Width High	30		ns
$T_{CPH}^1$	CE# Pulse Width High	30		ns
$T_{DS}$	Data Setup Time	30		ns
$T_{DH}^1$	Data Hold Time	0		ns
$T_{IDA}^1$	Software ID Access and Exit Time		150	ns
$T_{SE}$	Sector-Erase		25	ms
$T_{BE}$	Block-Erase		25	ms
$T_{SCE}$	Chip-Erase		100	ms
$T_{BY}^1$	RY/BY# Delay Time	90		ns
$T_{BR}$	Bus Recovery Time		1	$\mu$ s

T13.6 373

1. This parameter is measured only for initial qualification and after a design or process change that could affect this parameter.

FIGURE 13: CFI ENTRY AND READ

373 ILL F14.3

AC test inputs are driven at  $V_{IHT}$  ( $0.9 V_{DD}$ ) for a logic "1" and  $V_{ILT}$  ( $0.1 V_{DD}$ ) for a logic "0". Measurement reference points for inputs and outputs are  $V_{IT}$  ( $0.5 V_{DD}$ ) and  $V_{OT}$  ( $0.5 V_{DD}$ ). Input rise and fall times (10%  $\leftrightarrow$  90%) are  $<5$  ns.

**Note:**  $V_{IT}$  -  $V_{INPUT}$  Test  
 $V_{OT}$  -  $V_{OUTPUT}$  Test  
 $V_{IHT}$  -  $V_{INPUT}$  HIGH Test  
 $V_{ILT}$  -  $V_{INPUT}$  LOW Test

## PRODUCT ORDERING INFORMATION

### Valid combinations for SST36VF1601

SST36VF1601-70-4C-EK    SST36VF1601-70-4C-BK  
SST36VF1601-70-4E-EK    SST36VF1601-70-4E-BK

**Note:** Valid combinations are those products in mass production or will be in mass production. Consult your SST sales representative to confirm availability of valid combinations and to determine availability of new combinations.

PACKAGING DIAGRAMS

**48-LEAD THIN SMALL OUTLINE PACKAGE (TSOP) 12MM X 20MM**  
**SST PACKAGE CODE: EK**

**48-BALL THIN-PROFILE, FINE-PITCH BALL GRID ARRAY (TFBGA) 8MM X 10MM**  
**SST PACKAGE CODE: BK**
