

# +1.2V to +5.5V, ±15kV ESD-Protected, 0.1µA, 35Mbps, 8-Channel Level Translators

## General Description

The MAX3000E/MAX3001E/MAX3002–MAX3012 8-channel level translators provide the level shifting necessary to allow data transfer in a multivoltage system. Externally applied voltages, V<sub>CC</sub> and V<sub>L</sub>, set the logic levels on either side of the device. Logic signals present on the V<sub>L</sub> side of the device appear as a higher voltage logic signal on the V<sub>CC</sub> side of the device, and vice-versa.

The MAX3000E/MAX3001E/MAX3002/MAX3004–MAX3012 use an architecture specifically designed to be bidirectional without the use of a directional pin.

The MAX3000E/MAX3001E/MAX3002/MAX3004–MAX3012 feature an EN input that, when low, reduces the V<sub>CC</sub> and V<sub>L</sub> supply currents to <2µA. The MAX3000E/MAX3001E also have ±15kV ESD protection on the I/O V<sub>CC</sub> side for greater protection in applications that route signals externally. The MAX3000E operates at a guaranteed data rate of 230kbps. The MAX3001E operates at a guaranteed data rate of 4Mbps. The MAX3002–MAX3012 operate at a guaranteed data rate of 20Mbps over the entire specified operating voltage range.

The MAX3000E/MAX3001E/MAX3002–MAX3012 accept V<sub>L</sub> voltages from +1.2V to +5.5V and V<sub>CC</sub> voltages from +1.65V to +5.5V, making them ideal for data transfer between low-voltage ASICs/PLDs and higher voltage systems. The MAX3000E/MAX3001E/MAX3002–MAX3012 are available in 20-pin UCSP™ and 20-pin TSSOP packages.

## Applications

- CMOS Logic-Level Translation
- Cellphones
- SPI™ and MICROWIRE™ Level Translation
- Low-Voltage ASIC Level Translation
- Smart Card Readers
- Cellphone Cradles
- Portable POS Systems
- Portable Communication Devices
- Low-Cost Serial Interfaces
- GPS
- Telecommunications Equipment

*UCSP* is a trademark of Maxim Integrated Products, Inc.

*SPI* is a trademark of Motorola, Inc.

*MICROWIRE* is a trademark of National Semiconductor.

## Features

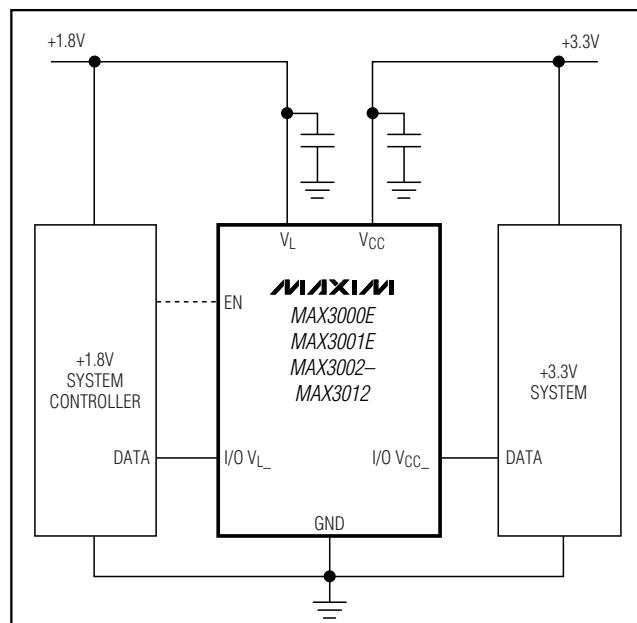

- ◆ Guaranteed Data Rate Options  
230kbps (MAX3000E)  
4Mbps (MAX3001E)  
20Mbps (MAX3002–MAX3012)
- ◆ Bidirectional Level Translation Without Using a Direction Pin (MAX3000E/MAX3001E/MAX3002/MAX3003)
- ◆ Unidirectional Level Translation (MAX3004–MAX3012)
- ◆ Operation Down to +1.2V on V<sub>L</sub>
- ◆ ±15kV ESD Protection on I/O V<sub>CC</sub> Lines (MAX3000E/MAX3001E)
- ◆ Ultra-Low 0.1µA Supply Current in Shutdown
- ◆ Low Quiescent Current (<10µA)
- ◆ UCSP and TSSOP Packages

## Ordering Information

PART	TEMP RANGE	PIN-PACKAGE
MAX3000EEUP	-40°C to +85°C	20 TSSOP
MAX3000EEBP-T	-40°C to +85°C	4 x 5 UCSP

*Ordering Information continued at end of data sheet.*

## Typical Operating Circuit

*Pin Configurations and Functional Diagrams appear at end of data sheet.*

**MAX3000E/MAX3001E/MAX3002-MAX3012**

# +1.2V to +5.5V, ±15kV ESD-Protected, 0.1µA, 35Mbps, 8-Channel Level Translators

## ABSOLUTE MAXIMUM RATINGS

All Voltages Referenced to GND

V <sub>CC</sub>	-0.3V to +6V
V <sub>L</sub>	-0.3V to +6V
I/O V <sub>CC</sub>	-0.3V to (V <sub>CC</sub> + 0.3V)
I/O V <sub>L</sub>	-0.3V to (V <sub>L</sub> + 0.3V)
EN, EN A/B	-0.3V to +6V
Short-Circuit Duration I/O V <sub>L</sub> , I/O V <sub>CC</sub> to GND	Continuous
Continuous Power Dissipation (T <sub>A</sub> = +70°C)	
20-Pin TSSOP (derate 7.0mW/°C above +70°C)	.....559mW
20-Pin UCSP (derate 10mW/°C above +70°C)	.....800mW

Operating Temperature Ranges

MAX3001EAUP	-40°C to +125°C
MAX300_EE_P	-40°C to +85°C
MAX300_E_P	-40°C to +85°C
Junction Temperature	+150°C
Storage Temperature Range	-65°C to +150°C
Lead Temperature (soldering, 10s)	+300°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## ELECTRICAL CHARACTERISTICS

(V<sub>CC</sub> = +1.65V to +5.5V, V<sub>L</sub> = +1.2V to V<sub>CC</sub>, EN = V<sub>L</sub> (MAX3000E/MAX3001E/MAX3002/MAX3004–MAX3012), EN A/B = V<sub>L</sub> or 0 (MAX3003), T<sub>A</sub> = T<sub>MIN</sub> to T<sub>MAX</sub>. Typical values are at V<sub>CC</sub> = +1.65V, V<sub>L</sub> = +1.2V, and T<sub>A</sub> = +25°C.) (Notes 1, 2)

**Note 1:** All units are 100% production tested at  $T_A = +25^\circ C$ . Limits over the operating temperature range are guaranteed by design and not production tested.

**Note 2:** For normal operation, ensure that  $V_L < V_{CC}$ . During power-up,  $V_L > V_{CC}$  does not damage the device.

## Detailed Description

The MAX3000E/MAX3001E/MAX3002–MAX3012 logic-level translators provide the level shifting necessary to allow data transfer in a multivoltage system. Externally applied voltages, V<sub>CC</sub> and V<sub>L</sub>, set the logic levels on either side of the device. Logic signals present on the V<sub>L</sub> side of the device appear as a higher voltage logic signal on the V<sub>CC</sub> side of the device, and vice-versa. The MAX3000E/MAX3001E/MAX3002/MAX3003 are bidirectional level translators allowing data translation in either direction (V<sub>L</sub> ↔ V<sub>CC</sub>) on any single data line. These devices use an architecture specifically designed to be bidirectional without the use of a direction pin. The MAX3004–MAX3012 unidirectional level translators level shift data in one direction (V<sub>L</sub> → V<sub>CC</sub> or V<sub>CC</sub> → V<sub>L</sub>) on any single data line. The MAX3000E/MAX3001E/ MAX3002–MAX3012 accept V<sub>L</sub> from +1.2V to +5.5V. All devices have V<sub>CC</sub> ranging from +1.65V to +5.5V, making them ideal for data transfer between low-voltage ASICs/PLDs and higher voltage systems.

The MAX3000E/MAX3001E/MAX3002/MAX3004–MAX3012 feature an output enable mode that reduces V<sub>CC</sub> supply current to less than 2µA, and V<sub>L</sub> supply current to less than 2µA when in shutdown. The MAX3000E/MAX3001E have ±15kV ESD protection on the V<sub>CC</sub> side for greater protection in applications that route signals externally. The MAX3000E operates at a guaranteed data rate of 230kbps; the MAX3001E operates at a guaranteed data rate of 4Mbps and the MAX3002–MAX3012 are guaranteed with a data rate of 20Mbps of operation over the entire specified operating voltage range.

## Level Translation

For proper operation, ensure that  $+1.65V \leq V_{CC} \leq +5.5V$ ,  $+1.2V \leq V_L \leq +5.5V$ , and  $V_L \leq V_{CC}$ . During power-up sequencing,  $V_L \geq V_{CC}$  does not damage the device. During power-supply sequencing, when V<sub>CC</sub> is floating and V<sub>L</sub> is powering up, up to 10mA current can be sourced to each load on the V<sub>L</sub> side, yet the device does not latch up.

The maximum data rate also depends heavily on the load capacitance (see the *Typical Operating Characteristics*), output impedance of the driver, and the operational voltage range (see the *Timing Characteristics*).

## Input Driver Requirements

The MAX3001E/MAX3002–MAX3012 architecture is based on a one-shot accelerator output stage. See Figure 5. Accelerator output stages are always in three-

state except when there is a transition on any of the translators on the input side, either I/O V<sub>L</sub> or I/O V<sub>CC</sub>.

When there is such a transition, the accelerator stages become active, charging (discharging) the capacitances at the I/Os. Due to its bidirectional nature, both stages become active during the one-shot pulse. This can lead to some current feeding into the external source that is driving the translator. However, this behavior helps to speed up the transition on the driven side.

For proper full-speed operation, the output current of a device that drives the inputs of the MAX3000E, MAX3001E, MAX3002–MAX3012 should meet the following requirements:

- MAX3000E (230kbps):  
 $i > 1mA$ ,  $R_{drv} < 1k\Omega$
- MAX3001E (4Mbps):  
 $i > 10^7 \times V \times (C + 10pF)$
- MAX3002–MAX3012 (20Mbps):  
 $i > 10^8 \times V \times (C + 10pF)$

Where, i is the driver output current, V is the logic-supply voltage (i.e., V<sub>L</sub> or V<sub>CC</sub>) and C is the parasitic capacitance of the signal line.

## Enable Output Mode (EN, EN A/B)

The MAX3000E/MAX3001E/MAX3002 and the MAX3004–MAX3012 feature an EN input, and the MAX3003 has an EN A/B input. Pull EN low to set the MAX3000E/MAX3001E/MAX3002/MAX3004–MAX3012s' I/O V<sub>CC1</sub> through I/O V<sub>CC8</sub> in three-state output mode, while I/O V<sub>L1</sub> through I/O V<sub>L8</sub> have internal  $6k\Omega$  pulldown resistors. Drive EN to logic high (V<sub>L</sub>) for normal operation. The MAX3003 is intended for bus multiplexing or bus switching applications. Drive EN A/B low to place channels 1B through 4B in active mode, while channels 1A through 4A are in three-state mode. Drive EN A/B to logic high (V<sub>L</sub>) to enable channels 1A through 4A, while channels 1B through 4B remain in three-state mode.

## ±15kV ESD Protection

As with all Maxim devices, ESD-protection structures are incorporated on all pins to protect against electrostatic discharges encountered during handling and assembly. The I/O V<sub>CC</sub> lines have extra protection against static discharge. Maxim's engineers have developed state-of-the-art structures to protect these pins against ESD of ±15kV without damage. The ESD structures withstand high ESD in all states: normal operation, three-state output mode, and powered down. After an ESD event, Maxim's E versions keep working without latchup, whereas competing products

## +1.2V to +5.5V, ±15kV ESD-Protected, 0.1µA, 35Mbps, 8-Channel Level Translators

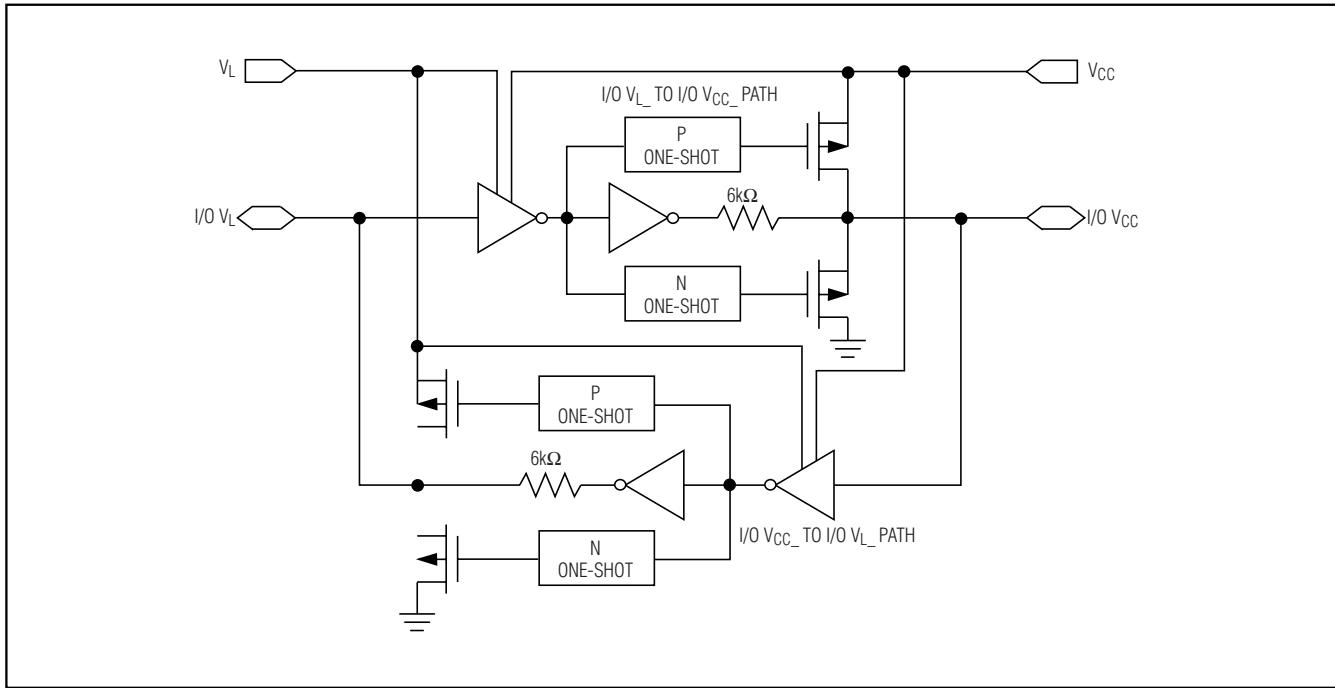

Figure 5. MAX3001E/MAX3002-MAX3012 Simplified Functional Diagram (1 I/O Line)

can latch and must be powered down to remove latchup.

ESD protection can be tested in various ways. The I/O Vcc lines of the MAX3000E/MAX3001E are characterized for protection to ±15kV using the Human Body Model.

### ESD Test Conditions

ESD performance depends on a variety of conditions. Contact Maxim for a reliability report that documents test setup, test methodology, and test results.

### Human Body Model

Figure 7a shows the Human Body Model and Figure 7b shows the current waveform it generates when discharged into a low impedance. This model consists of a 100pF capacitor charged to the ESD voltage of interest, which is then discharged into the test device through a 1.5kΩ resistor.

### Machine Model

The Machine Model for ESD tests all pins using a 200pF storage capacitor and zero discharge resistance. Its objective is to emulate the stress caused by contact that occurs with handling and assembly during

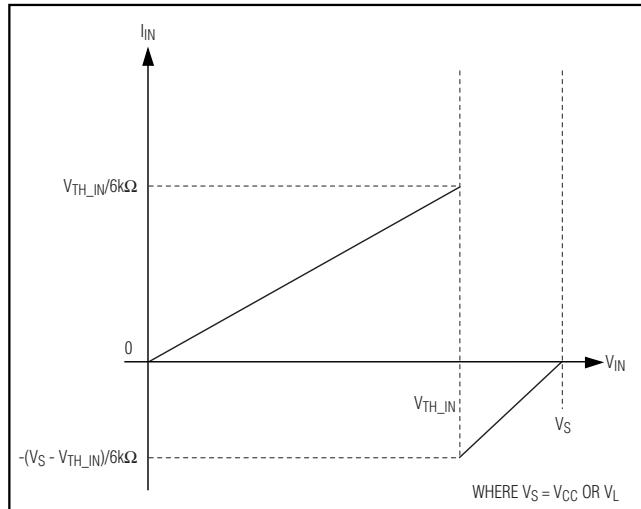

Figure 6. Typical  $I_{IN}$  vs.  $V_{IN}$

manufacturing. Of course, all pins require this protection during manufacturing, not just inputs and outputs. Therefore, after PC board assembly, the Machine Model is less relevant to I/O ports.

# **+1.2V to +5.5V, $\pm 15kV$ ESD-Protected, 0.1 $\mu$ A, 35Mbps, 8-Channel Level Translators**

## **Applications Information**

### **Power-Supply Decoupling**

To reduce ripple and the chance of transmitting incorrect data, bypass  $V_L$  and  $V_{CC}$  to ground with a 0.1 $\mu$ F capacitor. To ensure full  $\pm 15kV$  ESD protection, bypass  $V_{CC}$  to ground with a 1 $\mu$ F capacitor. Place all capacitors as close to the power-supply inputs as possible.

### **I<sup>2</sup>C Level Translation**

For I<sup>2</sup>C level translation for I<sup>2</sup>C applications, please refer to the MAX3372E–MAX3379E/MAX3390E–MAX3393E datasheet.

### **Unidirectional vs. Bidirectional Level Translator**

The MAX3000E/MAX3001E/MAX3002/MAX3003 bidirectional translators can operate as a unidirectional device to translate signals without inversion. The MAX3004–MAX3012 unidirectional level translators, level shift data in one direction ( $V_L \rightarrow V_{CC}$  or  $V_{CC} \geq V_L$ ) on any single data line (see Ordering Information.) These devices provide the smallest solution (UCSP package) for unidirectional level translation without inversion.
