## LOW SKEW ÷1, ÷2 CLOCK GENERATOR W/POLARITY CONTROL

### GENERAL DESCRIPTION

The ICS8701-01 is a low skew, ÷1, ÷2 Clock Generator and a member of the HiPerClockS™ family of High Performance Clock Solutions from ICS. The low impedance LVCMOS outputs are designed to drive 50Ω series or parallel terminated transmission lines. The effective fanout can be increased from 20 to 40 by utilizing the ability of the outputs to drive two series terminated lines.

The divide select inputs, DIV\_SELx, control the output frequency of each bank. The outputs can be utilized in the ÷1, ÷2 or a combination of ÷1 and ÷2 modes. The master reset/output enable input, nMR/OE, resets the internal dividers and controls the active and high impedance states of all outputs. The output polarity inputs, INV0:1, control the polarity (inverting or non-inverting) of the outputs of each bank. Outputs QA0-QA4 are inverting for every combination of the INV0:1 input. The timing relationship between the inverting and non-inverting outputs at different frequencies is shown in the Timing Diagrams.

The ICS8701-01 is characterized at 3.3V and mixed 3.3V input supply, and 2.5V output supply operating modes. Guaranteed bank, output and part-to-part skew characteristics make the ICS8701-01 ideal for those clock distribution applications demanding well defined performance and repeatability.
