Capacitance ($T_A = 25^\circ\text{C}$, $f = 1 \text{ MHz}$)

Parameters ⁽⁵⁾	Description	Test Conditions	Typ	Max.	Units
C_{IN}	Input Capacitance	$V_{IN} = 0V$		6	pF
C_{OFF}	In/Yn Capacitance, Switch Off	$V_{IN} = 0V$		6	pF
C_{ON}	In/Yn Capacitance, Switch On	$V_{IN} = 0V$		14	pF

Notes:

1. For Max. or Min. conditions, use appropriate value specified under Electrical Characteristics for the applicable device type.
2. Typical values are at $V_{CC} = 5.0V$, $T_A = 25^\circ\text{C}$ ambient and maximum loading.
3. Not more than one output should be shorted at one time. Duration of the test should not exceed one second.
4. Measured by the voltage drop between I and Y pin at indicated current through the switch. ON resistance is determined by the lower of the voltages on the two (I,Y) pins.
5. This parameter is determined by device characterization but is not production tested.

Power Supply Characteristics

Parameters	Description	Test Conditions ⁽¹⁾		Min.	Typ ⁽²⁾	Max.	Units
I _{CC}	Quiescent Power Supply Current	V _{CC} =Max.	V _{IN} =GND or V _{CC}		0.1	3.0	μA
DI _{CC}	Supply Current per Input @ TTL HIGH	V _{CC} =Max.	V _{IN} =3.4V ⁽³⁾			2.5	mA
ICCD	Supply Current per Input per MHz ⁽⁴⁾	V _{CC} =Max., I and Y Pins Open BE=GND Control Input Toggling 50% Duty Cycle				0.25	mA/ MHz

Notes:

1. For Max. or Min. conditions, use appropriate value specified under Electrical Characteristics for the applicable device.
2. Typical values are at V_{CC}=5.0V, +25°C ambient.
3. Per TTL driven input (V_{IN}=3.4V, control inputs only); I and Y pins do not contribute to I_{CC}.
4. This current applies to the control inputs only and represent the current required to switch internal capacitance at the specified frequency. The I and Y inputs generate no significant AC or DC currents as they transition. This parameter is not tested, but is guaranteed by design.

Switching Characteristics over Operating Range

Parameters	Description	Conditions ⁽¹⁾	PI5C3257		Units
			Com.		
			Min.	Max.	
t _{IY}	Propagation Delay ^(2,3) In to Y _n	CL = 50 pF RL = 500ohm		0.25	ns
t _{SY}	Bus Select Time Sn to Y _n		0.5	5.2	
t _{PZH} t _{PZL}	Bus Disable Time E̅ to Y _n		0.5	4.8	
t _{PHZ} t _{PLZ}	Bus Disable Time E̅ to Y _n		0.5	5.0	

Notes:

1. See test circuit and waveforms.
2. This parameter is guaranteed but not tested on Propagation Delays.
3. The bus switch contributes no propagational delay other than the RC delay of the ON resistance of the switch and the load capacitance. The time constant for the switch alone is of the order of 0.25ns for 50pF load. Since this time constant is much smaller than the rise/fall times of typical driving signals, it adds very little propagational delay to the system. Propagational delay of the bus switch when used in a system is determined by the driving circuit on the driving side of the switch and its interaction with the load on the driven side.
