MONOCHIP TELETEXT AND VPS DECODER WITH 8 INTEGRATED PAGES

- COMPLETE TELETEXT AND VPS DECODER INCLUDING AN 8 PAGE MEMORY ON A SINGLE CHIP
- UPWARD SOFTWARE COMPATIBLE WITH PREVIOUS SGS-THOMSON'S MULTICHIP SOLUTIONS (SAA5231, SDA5243, STV5345)
- PERFORM PDC SYSTEM A (VPS) AND PDC SYSTEM B (8/30/2) DATA STORAGE SEPARATELY
- DEDICATED "ERROR FREE" OUTPUT FOR VALID PDC DATA
- INDICATION OF LINE 23 FOR EXTERNAL USE
- SINGLE +5V SUPPLY VOLTAGE
- SINGLE 13.875MHz CRYSTAL
- REDUCED SET OF EXTERNAL COMPONENTS, NO EXTERNAL ADJUSTMENT
- OPTIMIZED NUMBER OF DIGITAL SIGNALS REDUCING EMC RADIATION
- HIGH DENSITY CMOS TECHNOLOGY
- DIGITAL DATA SLICER AND DISPLAY CLOCK PHASE LOCK LOOP
- 28 PIN DIP & SO PACKAGE

DESCRIPTION

The STV5348 decoder is a computer-controlled teletext device including an 8 page internal memory. Data slicing and capturing extracts the teletext information embedded in the composite video signal. Control is accomplished via a two wire serial I²C bus ®. Chip address is 22h. Internal ROM provides a character set suitable to display text using up to seven national languages. Hardware and software features allow selectable master/slave synchronization configurations. The STV5348 also supports facilities for reception and display of current level protocol data.

FUNCTIONAL DESCRIPTION

I - Displayable Page Memory Map

The organization of a page-memory is shown in Figure 7.

The display area consists of 25 rows of 40 characters per row.

The organization is as follows :

- Row zero contains the page header :
 - The first seven characters (0 - 6) are used for messages regarding the operational status.
 - The eighth character is an alphanumeric control character either "white" or "green" defining the "search" status of the page. When it is "white" the operational state is normal and the header appears white ; when it is "green" the opera-

tional state corresponds to the "search mode" and the header appears green.

- The following twenty-four characters give the header of the requested page when the system is in search mode.
- The last eight characters display the time of day.
- Row number twenty-four is used by the microprocessor for the display of information, or used to display X/24 colored key data according to R0D7 bit.
- Row twenty-five comprises ten bytes of control data concerning the received page (see Table 1) and fourteen free bytes which can be used by the microprocessor.

FUNCTIONAL DESCRIPTION (continued)

III - VPS DATA (see Table 2)

VPS data are stored in row 25 chapter 5 as shown in Table 2 when VPS enable bit (D4 of R8 register) is set. VPS data bits are decoded and stored in a received area with biphas error bit.

8/30/2 data are stored as received (without hamming decoding) in Row 23 chapter 5 according to Table 2. .

8/30 packet and VPS data decoding is the responsibility of the control software. The decoder simply stores transmitted data.

IV - I²C Bus Register Map (see Table 3)

Registers R0 to R10 are write only whilst R11A is

a read/write and R11B is read only.

The automatic succession on a byte by byte basis is indicated by the arrows in Table 3.

In the normal operating mode TB should be set to logic level 0.

After power-up the contents of the registers are as follows : all bits in registers R0 to R11A are cleared to zero with the exception of bits D0 and D1 in registers R5 and R6 which are set to logical one.

After power-up all the memory bytes are preset to hexadecimal value 20H (space) with the exception of the byte corresponding to row 0 of column 7 of chapter 0 which is set to the value corresponding to "alpha white" hexadecimal value 07H.

| | | DATA QUAL (D1) | Good TELETEXT signal (D1 = 1). Bad TELETEXT signal (D1 = 0). |
| | | 50/60Hz (D7) | If D1 = 0 frame frequency is 50Hz (only valid with good VCS) |

* Reading of R11A or R11B is determined by register 0, bit D0. However, write operation is always performed on R11A register.

Table 4 : Register R3

| START COLUMN | PRD4 | PRD3 | PRD2 | PRD1 | PRD0 |
|--------------|-----------------------|--------------------------|------|------|------|
| 0 | Do care magazine | $\overline{\text{HOLD}}$ | MAG2 | MAG1 | MAG0 |
| 1 | Do care page tens | PT3 | PT2 | PT1 | PT0 |
| 2 | Do care page units | PU3 | PU2 | PU1 | PU0 |
| 3 | Do care hours tens | X | X | HT1 | HT0 |
| 4 | Do care hours units | HU3 | HU2 | HU1 | HU0 |
| 5 | Do care minutes tens | X | MT2 | MT1 | MT0 |
| 6 | Do care minutes units | MU3 | MU2 | MU1 | MU0 |

The abbreviations have the same significance as in Table 1 with the exception of the "DO CARE" entries. It is only when this bit is "1" that the corresponding digit is taken into consideration on page request. For example, a page defined as "normal" or one defined as "timed" may be selected.

If $\overline{\text{HOLD}}$ is low the page is held. The addressing of successive bytes via the I²C is automatic.

V - Character Sets

The complete character set with 8-bit decoding is given in Table 5.

Characters in columns 0 and 1 are normally displayed as blanks. Black dots represent the character shape whereas white dots represent the background.

Each character can be identified by a pair of corre-

sponding row and column integers : for example the character "3" may be indicated by 3/3.

A rectangle may be represented as follows :

The characters 8/6, 8/7, 9/5, 9/7 are used as special characters, always in conjunction with 8/5.

The 13 national characters are placed in columns with bit 8 = 0.
