

CAT6217

150 mA CMOS LDO Regulator

Description

The CAT6217 is a 150 mA CMOS low dropout regulator that provides fast response time during load current and line voltage changes.

The quick-start feature allows the use of an external bypass capacitor to reduce the overall output noise without affecting the turn-on time of just 150 μ s.

With zero shutdown current and low ground current of 55 μ A typical, the CAT6217 is ideal for battery-operated devices with supply voltages from 2.3 V to 5.5 V. An internal under voltage lockout circuit disables the output at supply voltages under 2.1 V typical.

The CAT6217 offers 1% initial accuracy and low dropout voltage, 90 mV typical at 150 mA. Stable operation is provided with a 1 μ F ceramic capacitor, reducing required board space and component cost.

Other features include output short-circuit current limit and thermal protection.

The device is available in the low profile (1 mm max height) 5-lead TSOT-23 package.

Figure 2. CAT6217 Functional Block Diagram

Pin Function

VIN is the supply pin for the LDO. A small 1 μF ceramic bypass capacitor is required between the VIN pin and ground near the device. When using longer connections to the power supply, CIN value can be increased without limit. The operating input voltage range is from 2.3 V to 5.5 V.

EN is the enable control logic (active high) for the regulator output. It has a 2.5 MΩ pull-down resistor, which assures that if EN pin is left open, the circuit is disabled.

VOUT is the LDO regulator output. A small 1 μF ceramic bypass capacitor is required between the VOUT pin and ground for stability. For better transient response, its value can be increased to 4.7 μF.

The capacitor should be located near the device. ESR domain is 5 mΩ to 500 mΩ. VOUT can deliver a maximum guaranteed current of 150 mA. A 250 Ω internal shutdown switch discharges the output capacitor in the no-load condition.

GND is the ground reference for the LDO. The pin must be connected to the ground plane on the PCB.

BYP is the reference bypass pin. An optional 0.01 μF capacitor can be connected between BYP pin and GND to reduce the output noise and enhance the PSRR at high frequency.

Table 1. ABSOLUTE MAXIMUM RATINGS

Parameter	Rating	Unit
VIN	0 to 6.5	V
VEN, VOUT	-0.3 to VIN + 0.3	V
Junction Temperature, TJ	+150	°C
Power Dissipation, PD	Internally Limited (Note 1)	mW
Storage Temperature Range, TS	-65 to +150	°C
Lead Temperature (soldering, 5 sec.)	260	°C
ESD Rating (Human Body Model)	3	kV

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

Table 2. RECOMMENDED OPERATING CONDITIONS (Note 2)

Parameter	Range	Unit
VIN	2.3 to 5.5	V
VEN	0 to VIN	V
Junction Temperature Range, TJ	-40 to +125	°C
Package Thermal Resistance (SOT23-5), θJA	235	°C/W

NOTE: Typical application circuit with external components is shown above.

- The maximum allowable power dissipation at any TA (ambient temperature) is $P_{Dmax} = (T_{Jmax} - T_A)/\theta_{JA}$. Exceeding the maximum allowable power dissipation will result in excessive die temperature, and the regulator will go into thermal shutdown.
- The device is not guaranteed to work outside its operating rating.
