

Description

The GM71V(S)16163A/AL is the new generation dynamic RAM organized 1,048,576 words x 16 bit. GM71V(S)16163A/AL has realized higher density, higher performance and various functions by utilizing advanced CMOS process technology. The GM71V(S)16163A/AL offers Extended Data Out (EDO) Mode as a high speed access mode. Multiplexed address inputs permit the GM71V(S)16163A/AL to be packaged in standard 400 mil 42pin plastic SOJ, and standard 400mil 44(50)pin plastic TSOP II. The package size provides high system bit densities and is compatible with widely available automated testing and insertion equipment. System oriented features include single power supply 3.3V ± 0.3V tolerance, direct interfacing capability with high performance logic families such as Schottky TTL.

- Low Power
Active : 360 / 324 / 288mW (MAX)
Standby : 3.6mW (CMOS level : MAX)
0.54mW (L-version : MAX)
- RAS Only Refresh, CAS before RAS Refresh, Hidden Refresh Capability
- Self Refresh Operation (L-version)
- All inputs and outputs TTL Compatible
- 4096 Refresh Cycles/64ms
- 4096 Refresh Cycles/128ms (L-version)
- Battery Back Up Operation (L-version)
- 2 CAS byte Control

2. $t_{wCS} \geq 0ns$: Early write cycle, $t_{wCS} \leq 0ns$: Delayed write cycle

3. Mode is determined by the OR function of the \overline{UCAS} and \overline{LCAS} . (Mode is set by the earliest of \overline{UCAS} and \overline{LCAS} active edge and reset by the latest of \overline{UCAS} and \overline{LCAS} inactive edge.)

However write OPERATION and output High-Z control are done independently by each \overline{UCAS} , \overline{LCAS} .
ex) if $\overline{RAS} = \text{H to L}$, $\overline{LCAS} = \text{L}$, $\overline{UCAS} = \text{H}$, then \overline{CAS} -before- \overline{RAS} refresh cycle is selected.

Notes :

1. AC measurements assume $t_r = 2 \text{ ns}$.
2. An initial pause of $200 \mu\text{s}$ is required after power followed by a minimum of eight initialization cycles (any combination of cycles containing RAS-only refresh or CAS-before-RAS refresh).
3. Operation with the $t_{\text{rCD}}(\text{max})$ limit insures that $t_{\text{rAC}}(\text{max})$ can be met, $t_{\text{rCD}}(\text{max})$ is specified as a reference point only; if t_{rCD} is greater than the specified $t_{\text{rCD}}(\text{max})$ limit, then access time is controlled exclusively by t_{CAC} .
4. Operation with the $t_{\text{rAD}}(\text{max})$ limit insures that $t_{\text{rAC}}(\text{max})$ can be met, $t_{\text{rAD}}(\text{max})$ is specified as a reference point only; if t_{rAD} is greater than the specified $t_{\text{rAD}}(\text{max})$ limit, then access time is controlled exclusively by t_{AA} .
5. Either t_{ODD} or t_{CDD} must be satisfied.
6. Either t_{DZO} or t_{DZC} must be satisfied.
7. $V_{\text{IH}}(\text{min})$ and $V_{\text{IL}}(\text{max})$ are reference levels for measuring timing of input signals. Also, transition times are measured between $V_{\text{IH}}(\text{min})$ and $V_{\text{IL}}(\text{max})$.
8. Assumes that $t_{\text{rCD}} \leq t_{\text{rCD}}(\text{max})$ and $t_{\text{rAD}} \leq t_{\text{rAD}}(\text{max})$. If t_{rCD} or t_{rAD} is greater than the maximum recommended value shown in this table, t_{rAC} exceeds the value shown.
9. Measured with a load circuit equivalent to 1TTL loads and 100pF.
10. Assumes that $t_{\text{rCD}} \geq t_{\text{rCD}}(\text{max})$ and $t_{\text{rAD}} \leq t_{\text{rAD}}(\text{max})$.
11. Assumes that $t_{\text{rCD}} \leq t_{\text{rCD}}(\text{max})$ and $t_{\text{rAD}} \geq t_{\text{rAD}}(\text{max})$.
12. Either t_{rCH} or t_{rRH} must be satisfied for a read cycles.
13. $t_{\text{OFF}}(\text{max})$ and $t_{\text{OEZ}}(\text{max})$ define the time at which the outputs achieve the open circuit condition and are not referred to output voltage levels.
14. t_{WCS} , t_{rWD} , t_{CWD} , t_{AWD} and t_{CPW} are not restrictive operating parameters. They are included in the data sheet as electrical characteristics only; if $t_{\text{WCS}} \geq t_{\text{WCS}}(\text{min})$, the cycle is an early write cycle and the data out pin will remain open circuit (high impedance) throughout the entire cycle; if $t_{\text{rWD}} \geq t_{\text{rWD}}(\text{min})$, $t_{\text{CWD}} \geq t_{\text{CWD}}(\text{min})$, and $t_{\text{AWD}} \geq t_{\text{AWD}}(\text{min})$, or $t_{\text{CWD}} \geq t_{\text{CWD}}(\text{min})$ $t_{\text{AWD}} \geq t_{\text{AWD}}(\text{min})$ and $t_{\text{CPW}} \geq t_{\text{CPW}}(\text{min})$, the cycle is a read-modify-write and the data output will contain data read from the selected cell; if neither of the above sets of conditions is satisfied, the condition of the data out (at access time) is indeterminate.
15. These parameters are referred to $\overline{\text{UCAS}}$ and $\overline{\text{LCAS}}$ leading edge in early write cycles and to $\overline{\text{WE}}$ leading edge in delayed write or read-modify-write cycles.
16. t_{RASP} defines $\overline{\text{RAS}}$ pulse width in EDO mode cycles.
17. Access time is determined by the longer of t_{AA} or t_{CAC} or t_{ACP} .
18. In delayed write or read-modify-write cycles, $\overline{\text{OE}}$ must disable output buffer prior to applying data to the device. After $\overline{\text{RAS}}$ is reset, if $t_{\text{OEH}} \geq t_{\text{CWL}}$, the I/O pin will remain open circuit (high impedance); if $t_{\text{OEH}} \leq t_{\text{CWL}}$, invalid data will be out at each I/O.
19. When both $\overline{\text{LCAS}}$ and $\overline{\text{UCAS}}$ go low at the same time, all 16-bits data are written into the device. $\overline{\text{LCAS}}$ and $\overline{\text{UCAS}}$ cannot be staggered within the same write/read cycles.
20. All the V_{CC} and V_{SS} pins shall be supplied with the same voltages.
21. t_{ASC} , t_{CAH} , t_{RCS} , t_{WCS} , t_{WCH} , t_{CSR} and t_{RPC} are determined by the earlier falling edge of $\overline{\text{UCAS}}$ or $\overline{\text{LCAS}}$.
22. t_{CRP} , t_{CHR} , t_{rCH} , t_{ACP} and t_{CPW} are determined by the later rising edge of $\overline{\text{UCAS}}$ or $\overline{\text{LCAS}}$.
23. t_{CWL} , t_{DH} , t_{DS} and t_{CHS} should be satisfied by both $\overline{\text{UCAS}}$ and $\overline{\text{LCAS}}$.
24. t_{CP} is determined by the time that both $\overline{\text{UCAS}}$ and $\overline{\text{LCAS}}$ are high.

25. $t_{HPC}(\min)$ can be achieved during a series of EDO page made write cycles or EDO mode write cycles. It both write and read operation are mixed in a EDO mode \overline{RAS} cycle(EDO mode mix cycle (1),(2)) minimum Value of \overline{CAS} cycle ($t_{CAS}+t_{CP}+2t_T$) becomes greater than the specified $t_{HPC}(\min)$ value. The value of \overline{CAS} cycle time of mixed EDO mode is shown in EDO mode mix cycle (1) and (2).
26. When output buffers are enabled once, sustain the low impedance state until valid data is obtained. When output buffer is turned on and off within a very short time, generally it causes large V_{CC}/V_{SS} line noise, which causes to degrade $V_{IH\min}/V_{IL\max}$ level.
27. Data output turns off and becomes high impedance from later rising edge of \overline{RAS} and \overline{CAS} . Hold time and turn off time are specified by the timing specification of later rising edge of \overline{RAS} and \overline{CAS} between t_{OHR} and t_{OH} , and between t_{OFR} and t_{OFF} .
28. EDO Hi-Z control by \overline{OE} or \overline{WE} . \overline{OE} rising edge disables data outputs. When \overline{OE} goes high during \overline{CAS} high, the data will not come out until next \overline{CAS} access. When \overline{WE} goes low during \overline{CAS} high, the data will not come out until next \overline{CAS} access.
29. Please do not use t_{RASS} timing, $10\mu s \leq t_{RASS} \leq 100\mu s$. During this period, the device is in transition state from normal operation mode to self refresh mode. If $t_{RASS} \geq 100\mu s$, then RAS precharge time should use t_{RPS} instead of t_{RP} .
30. H or L (H : $V_{IH}(\min) \leq V_{IN} \leq V_{IH}(\max)$, L : $V_{IL}(\min) \leq V_{IN} \leq V_{IL}(\max)$)

Notes concerning 2CAS control

Please do not separate the $\overline{UCAS}/\overline{LCAS}$ operation timing intentionally. However skew between $\overline{UCAS}/\overline{LCAS}$ are allowed under the following conditions.

- (1) Each of the $\overline{UCAS}/\overline{LCAS}$ should satisfy the timing specifications individually.
- (2) Different operation mode for upper/lower byte is not allowed; such as following.

- (3) Closely separated upper/lower byte control is not allowed. However when the condition ($t_{CP} \leq t_{UL}$) is satisfied, EDO page mode can be performed.

- (4) Byte control operation by remaining \overline{LCAS} or \overline{UCAS} high is guaranteed.

The low self refresh current is achieved by introducing extremely long internal refresh cycle. Therefore some care needs to be taken on the refresh.

1. Please do not t_{RASS} timing, $10 \mu\text{s} \leq t_{\text{RASS}} \leq 100 \mu\text{s}$. During this period, the device is in transition state from normal operation mode to self refresh mode. If $t_{\text{RASS}} \geq 100 \mu\text{s}$, then $\overline{\text{RAS}}$ precharge time should use t_{RPPS} instead of t_{RP} .
2. If you use $\overline{\text{RAS}}$ only refresh or CBR burst refresh mode in normal read/write cycle, 4096 cycles of distributed CBR refresh with $15.6 \mu\text{s}$ interval should be executed within 64ms immediately after exiting from and before entering into the self refresh mode.
3. If you use distributed CBR refresh mode with $15.6 \mu\text{s}$ interval in normal read/write cycle, CBR refresh should be executed within $15.6 \mu\text{s}$ immediately after exiting from and before entering into the self refresh mode.
4. Repetitive self refresh mode without refreshing all memory is not allowed. Once you exit from self refresh mode, all memory cells need to be refreshed before re-entering the self refresh mode again.
