## Constant Frequency Current Mode Flyback DC/DC Controller in ThinSOT

## feATURES

- $\mathrm{V}_{\text {IN }}$ and $\mathrm{V}_{\text {OUT }}$ Limited Only by External Components
- 4.8V Undervoltage Lockout Threshold
- Operating Junction Temperature from $-40^{\circ} \mathrm{C}$ to $150^{\circ} \mathrm{C}$
- Adjustable Slope Compensation
- Internal Soft-Start
- Constant Frequency 200kHz Operation
- $\pm 1.5 \%$ Reference Accuracy
- Current Mode Operation for Excellent Line and Load Transient Response
- No Minimum Load Requirement
- Low Quiescent Current: 240uA
- Low Profile (1mm) SOT-23 Package

## APPLICATIONS

- 42V and 12V Automotive Power Supplies
- Telecom Power Supplies
- Auxiliary/Housekeeping Power Supplies
- Power Over Ethernet

## DESCRIPTIOn

The LTC ${ }^{\circledR} 3803-5$ is a constant frequency current mode flyback controller optimized for driving 4.5 V and 6 V -rated N -channel MOSFETs in high input voltage applications. The LTC3803-5 operates from inputs as low as 5 V . Constant frequency operation is maintained down to very light loads, resulting in less low frequency noise generation over a wide range of load currents. Slope compensation can be programmed with an external resistor.
The LTC3803-5 provides $\pm 1.5 \%$ output voltage accuracy and consumes only $240 \mu \mathrm{~A}$ of quiescent current. Groundreferenced current sensing allows LTC3803-5-based converters to accept input supplies beyond the LTC3803-5's absolute maximum V ${ }_{\text {Cc }}$. For simplicity, the LTC3803-5 can be powered from a high $V_{1 \mathbb{N}}$ through a resistor, due to its internal 8 V shunt regulator. An internal undervoltage lockout shuts down the IC when the input voltage falls below 3.2 V , guaranteeing at least 3.2 V of gate drive to the external MOSFET.

The LTC3803-5 is available in a low profile ( 1 mm ) 6-lead SOT-23 (ThinSOT ${ }^{\text {TM }}$ ) package.

Note 1: Absolute Maximum Ratings are those values beyond which the life of a device may be impaired.
Note 2: The LTC3803H-5 is guaranteed to meet specifications from $-40^{\circ} \mathrm{C}$ to $150^{\circ} \mathrm{C}$. The LTC3803E-5 is guaranteed to meet specifications from $0^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$ with specifications over the $-40^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$ temperature range assured by design, characterization and correlation with statistical process controls.
Junction temperature ( $\mathrm{T}_{\mathrm{J})}$ is calculated from the ambient temperature $\mathrm{T}_{\mathrm{A}}$ and the power dissipation $P_{D}$ in the LTC3803-5 using the formula:

$$
\mathrm{T}_{J}=\mathrm{T}_{\mathrm{A}}+\left(\mathrm{P}_{\mathrm{D}} \cdot 230^{\circ} \mathrm{C} / \mathrm{W}\right)
$$

Note 3: High junction temperatures degrade operating lifetimes. Operating
lifetime at junction temperatures greater than $125^{\circ} \mathrm{C}$ is derated to 1000 hours.
Note 4: Dynamic supply current is higher due to the gate charge being delivered at the switching frequency.
Note 5: The LTC3803-5 is tested in a feedback loop that servos $V_{F B}$ to the output of the error amplifier while maintaining $\left.\right|_{T H} /$ RUN at the midpoint of the current limit range.
Note 6: Peak current sense voltage is reduced dependent on duty cycle and an optional external resistor in series with the SENSE pin ( $\mathrm{R}_{\mathrm{SL}}$ ). For details, refer to the programmable slope compensation feature in the Applications Information section.
Note 7: Guaranteed by design.

## LTC3803-5

## PIn functions

$\mathrm{I}_{\mathrm{Th}} /$ RUN (Pin 1): This pin performs two functions. It serves as the error amplifier compensation point as well as the run/shutdown control input. Nominal voltage range is 0.7 V to 1.9 V . Forcing this pin below 0.28 V causes the LTC3803-5 to shut down. In shutdown mode, the NGATE pin is held low.
GND (Pin 2): Ground Pin.
$V_{\text {FB }}$ (Pin 3): Receives the feedback voltage from an external resistive divider across the output.

SENSE (Pin 4): This pin performs two functions. It monitors switch current by reading the voltage across an external current sense resistor to ground. It also injects a current ramp that develops slope compensation voltage across an optional external programming resistor.
VCC (Pin 5): Supply Pin. Must be closely decoupled to GND (Pin 2).
NGATE (Pin 6): Gate Drive for the External N-Channel MOSFET. This pin swings from OV to $\mathrm{V}_{\mathrm{Cc}}$.

## BLOCK DIAGRAM

## OPERATION

The LTC3803-5 is a constant frequency current mode controller for flyback, SEPIC and DC/DC boost converter applications in a tiny ThinSOT package. The LTC3803-5 is designed so that none of its pins need to come in contact with the input or output voltages of the power supply circuit of which it is a part, allowing the conversion of voltages well beyond the LTC3803-5's absolute maximum ratings.

## Main Control Loop

Due to space limitations, the basics of current mode DC/DC conversion will not be discussed here; instead, the reader is referred to the detailed treatment in Application Note 19, or in texts such as Abraham Pressman's Switching Power Supply Design.

Please refer to the Block Diagram and the Typical Application on the front page of this data sheet. An external resistive voltage divider presents a fraction of the output voltage to the $\mathrm{V}_{\text {FB }}$ pin. The divider must be designed so that when the output is at the desired voltage, the $\mathrm{V}_{\mathrm{FB}}$ pin voltage will equal the 800 mV from the internal reference. If the load current increases, the output voltage will decrease slightly, causing the $\mathrm{V}_{\text {FB }}$ pin voltage to fall below 800 mV . The error amplifier responds by feeding current into the $I_{T H} /$ RUN pin. If the load current decreases, the $V_{F B}$ voltage will rise above 800 mV and the error amplifier will sink current away from the $\mathrm{I}_{\mathrm{TH}} /$ RUN pin.
The voltage at the $I_{T H} /$ RUN pin commands the pulse-width modulator formed by the oscillator, current comparator and RS latch. Specifically, the voltage at the $I_{T H} / R U N$ pin sets the current comparator's trip threshold. The current comparator monitors the voltage across a current sense resistor in series with the source terminal of the external MOSFET. The LTC3803-5 turns on the external power MOSFET when the internal free-running 200kHz oscillator sets the RS latch. It turns off the MOSFET when the current comparator resets the latch or when $80 \%$ duty cycle is reached, whichever happens first. In this way, the peak current levels through the flyback transformer's primary and secondary are controlled by the $I_{T H} / R U N$ voltage.
Since the $I_{T H} /$ RUN voltage is increased by the error amplifier whenever the output voltage is below nominal, and
decreased whenever output voltage exceeds nominal, the voltage regulation loop is closed. For example, whenever the load current increases, output voltage will decrease slightly, and sensing this, the error amplifier raises the $I_{T H} / R U N$ voltage by sourcing current into the $I_{T H} / R U N$ pin, raising the current comparator threshold, thus increasing the peak currents through the transformer primary and secondary. This delivers more current to the load, bringing the output voltage back up.
The $I_{T H} / R U N$ pin serves as the compensation point for the control loop. Typically, an external series RC network is connected from $I_{T H} /$ RUN to ground and is chosen for optimal response to load and line transients. The impedance of this RC network converts the output current of the error amplifier to the $I_{T H} /$ RUN voltage which sets the current comparator threshold and commands considerable influence over the dynamics of the voltage regulation loop.

## Start-Up/Shutdown

The LTC3803-5 has two shutdown mechanisms to disable and enable operation: an undervoltage lockout on the $\mathrm{V}_{C C}$ supply pin voltage, and a forced shutdown whenever external circuitry drives the $\mathrm{I}_{\mathrm{TH}} /$ RUN pin low. The LTC38035 transitions into and out of shutdown according to the state diagram (Figure 1).

Figure 1. Start-Up/Shutdown State Diagram

## operation

The undervoltage lockout (UVLO) mechanism prevents the LTC3803-5 from trying to drive a MOSFET with insufficient $V_{G S}$. The voltage at the $V_{C C}$ pin must exceed VTURNON (nominally 4.8V) at least momentarily to enable LTC3803-5 operation. The $V_{C C}$ voltage is then allowed to fall to $\mathrm{V}_{\text {TURNOFF }}$ (nominally 4V) before undervoltage lockout disables the LTC3803-5.

The $\mathrm{I}_{\mathrm{TH}} /$ RUN pin can be driven below $\mathrm{V}_{\text {SHDN }}$ (nominally 0.28 V ) to force the LTC3803-5 into shutdown. An internal $0.3 \mu \mathrm{~A}$ current source always tries to pull this pin towards $V_{C C}$. When the $I_{T H} / R U N$ pin voltage is allowed to exceed $V_{\text {SHDN }}$, and $V_{\text {CC }}$ exceeds $V_{\text {TURNON }}$, the LTC3803-5 begins to operate and an internal clamp immediately pulls the $I_{T H} /$ RUN pin up to about 0.7 V . In operation, the $I_{T H} / R U N$ pin voltage will vary from roughly 0.7 V to 1.9 V to represent current comparator thresholds from zero to maximum.

## Internal Soft-Start

An internal soft-start feature is enabled whenever the LTC3803-5 comes out of shutdown. Specifically, the $I_{T H} / R U N$ voltage is clamped and is prevented from reaching maximum until roughly 0.7 ms has passed. This allows the input and output currents of LTC3803-5based power supplies to rise in a smooth and controlled manner on start-up.

## Powering the LTC3803-5

In the simplest case, the LTC3803-5 can be powered from a high voltage supply through a resistor. A built-in shunt regulator from the $V_{\text {CC }}$ pin to GND will draw as much current as needed through this resistor to regulate the $\mathrm{V}_{C C}$ voltage to around 8 V as long as the $\mathrm{V}_{C C}$ pin is not forced to sink more than 25 mA . This shunt regulator is always active, even when the LTC3803-5 is in shutdown, since it serves the vital function of protecting the $\mathrm{V}_{\mathrm{CC}}$ pin from seeing too much voltage.
The $V_{\text {CC }}$ pin must be bypassed to ground immediately adjacent to the IC pins with a ceramic or tantalum capacitor. Proper supply bypassing is necessary to supply the high transient currents required by the MOSFET gate driver. $10 \mu \mathrm{~F}$ is a good starting point.

## Adjustable Slope Compensation

The LTC3803-5 injects a $5 \mu \mathrm{~A}$ peak current ramp out through its SENSE pin which can be used for slope compensation in designs that require it. This current ramp is approximately linear and begins at zero current at 6.5\% duty cycle, reaching peak current at $80 \%$ duty cycle. Additional details are provided in the Applications Information section.

## APPLICATIONS INFORMATION

Many LTC3803-5 application circuits can be derived from the topology shown in Figure 2.
The LTC3803-5 itself imposes no limits on allowed power output, input voltage $\mathrm{V}_{\text {IN }}$ or desired regulated output voltage $\mathrm{V}_{\text {OUT; }}$; these are all determined by the ratings on the external power components. The key factors are: Q1's maximum drain-source voltage ( $\mathrm{BV}_{\mathrm{DSS}}$ ), on-resistance ( $\mathrm{R}_{\mathrm{DS}(\mathrm{ON})}$ ) and maximum drain current, T1's saturation flux level and winding insulation breakdown voltages, $\mathrm{C}_{\mathrm{IN}}$ and $\mathrm{C}_{\text {OUT' }}$ 's maximum working voltage, ESR, and maximum ripple current ratings, and D1 and $R_{\text {SENSE }}$ 's power ratings.

Figure 2. Typical LTC3803-5 Application Circuit

## SELECTING FEEDBACK RESISTOR DIVIDER VALUES

The regulated output voltage is determined by the resistor divider across $\mathrm{V}_{\text {OUT }}$ (R1 and R2 in Figure 2). The ratio of R2 to R1 needed to produce a desired $\mathrm{V}_{\text {OUt }}$ can be calculated:

$$
\mathrm{R} 2=\frac{\mathrm{V}_{\text {OUT }}-0.8 \mathrm{~V}}{0.8 \mathrm{~V}} \cdot \mathrm{R} 1
$$

Choose resistance values for R1 and R2 to be as large as possible in order to minimize any efficiency loss due to the static current drawn from $V_{\text {OUT }}$, but just small enough so that when $\mathrm{V}_{\text {OUT }}$ is in regulation, the error caused by the nonzero input current to the $\mathrm{V}_{\mathrm{FB}}$ pin is less than $1 \%$. A good rule of thumb is to choose R1 to be 80k or less.

## TRANSFORMER DESIGN CONSIDERATIONS

Transformer specification and design is perhaps the most critical part of applying the LTC3803-5 successfully. In addition to the usual list of caveats dealing with high frequency power transformer design, the following should prove useful.

## Turns Ratios

Due to the use of the external feedback resistor divider ratio to set output voltage, the user has relative freedom in selecting transformer turns ratio to suit a given application. Simple ratios of small integers, e.g., 1:1, 2:1, 3:2, etc. can be employed which yield more freedom in setting total turns and mutual inductance. Simple integer turns ratios also facilitate the use of "off-the-shelf" configurable transformers such as the Coiltronics VERSA-PAC ${ }^{\text {TM }}$ series in applications with high input to output voltage ratios. For example, if a 6 -winding VERSA-PAC is used with three windings in series on the primary and three windings in parallel on the secondary, a3:1 turns ratio will be achieved.
Turns ratio can be chosen on the basis of desired duty cycle. However, remember that the input supply voltage plus the secondary-to-primary referred version of the flyback pulse (including leakage spike) must not exceed the allowed external MOSFET breakdown rating.

## Leakage Inductance

Transformer leakage inductance (on either the primary or secondary) causes a voltage spike to occur after the output switch (Q1) turn-off. This is increasingly prominent at higher load currents, where more stored energy must be dissipated. In some cases a "snubber" circuit will be required to avoid overvoltage breakdown at the MOSFET's drain node. Application Note 19 is a good reference on snubber design.
A bifilar or similar winding technique is a good way to minimize troublesome leakage inductances. However, remember that this will limit the primary-to-secondary breakdown voltage, so bifilar winding is not always practical.

## APPLICATIONS INFORMATION

## CURRENT SENSE RESISTOR CONSIDERATIONS

The external current sense resistor ( $\mathrm{R}_{\text {SENSE }}$ in Figure 2) allows the user to optimize the current limit behavior for the particular application. As the current sense resistor is varied from several ohms down to tens of milliohms, peak switch current goes from a fraction of an ampere to several amperes. Care must be taken to ensure proper circuit operation, especially with small current sense resistor values.

For example, a peak switch current of 5 A requires a sense resistor of $0.020 \Omega$. Note that the instantaneous peak power in the sense resistor is 0.5 W and it must be rated accordingly. The LTC3803-5 has only a single sense line to this resistor. Therefore, any parasitic resistance in the ground side connection of the sense resistor will increase its apparent value. In the case of a $0.020 \Omega$ sense resistor, one milliohm of parasitic resistance will cause a $5 \%$ reduction in peak switch current. So the resistance of printed circuit copper traces and vias cannot necessarily be ignored.

## PROGRAMMABLE SLOPE COMPENSATION

The LTC3803-5 injects a ramping current through its SENSE pin into an external slope compensation resistor ( $\mathrm{R}_{\mathrm{SL}}$ in Figure 2). This current ramp starts at zero right after the NGATE pin has been high for the LTC3803-5's minimum duty cycle of $6.5 \%$. The current rises linearly towards a peak of $5 \mu \mathrm{~A}$ at the maximum duty cycle of $80 \%$, shutting off once the NGATE pin goes low. A series resistor ( $\mathrm{R}_{\mathrm{SL}}$ ) connecting the SENSE pin to the current sense resistor ( $\mathrm{R}_{\text {SENSE }}$ ) thus develops a ramping voltage drop. From the perspective of the SENSE pin, this ramping voltage adds to the voltage across the sense resistor, effectively reducing the current comparator threshold in proportion to duty cycle. This stabilizes the control loop

Figure 3. Powering the LTC3803-5 Via the Internal Shunt Regulator
against subharmonic oscillation. The amount of reduction in the current comparator threshold ( $\Delta \mathrm{V}_{\text {SENSE }}$ ) can be calculated using the following equation:

$$
\Delta V_{\text {SENSE }}=\frac{\text { Duty Cycle }-6.5 \%}{73.5 \%} \cdot 5 \mu \mathrm{~A} \cdot \mathrm{R}_{\mathrm{SL}}
$$

Note: LTC3803-5 enforces 6.5\% < Duty Cycle < 80\%.
A good starting value for $R_{S L}$ is 5.9 k , which gives a 30 mV drop in current comparator threshold at $80 \%$ duty cycle. Designs not needing slope compensation may replace $R_{S L}$ with a short circuit.

## VCC SHUNT REGULATOR

An internal shunt regulator allows the LTC3803-5 to be powered through a single dropping resistor from $\mathrm{V}_{\text {IN }}$ to $V_{C C}$, in conjunction with a bypass capacitor, $\mathrm{C}_{V C C}$, that closely decouples V CC $^{\text {to }}$ GND (see Figure 3). The shunt regulator can draw up to 25 mA through the $\mathrm{V}_{\text {CC }}$ pin to GND to drop enough voltage across $R_{V C C}$ to regulate $V_{C C}$ to around 8 V . For applications where $\mathrm{V}_{\text {IN }}$ is low enough such that the static power dissipation in Rvcc is acceptable, using the $\mathrm{V}_{C C}$ shunt regulator is the simplest way to power the LTC3803-5.

## EXTERNAL PREREGULATOR

The circuit in Figure 4 shows another way to power the LTC3803-5. An external series preregulator consisting of series pass transistor Q1, Zener diode D1, and bias resistor $R_{B}$ brings $V_{C C}$ above the $V_{C C}$ turn-on threshold, enabling the LTC3803-5.

Figure 4. Powering the LTC3803-5 with an External Preregulator

## TYPICAL APPLICATIONS

2W Isolated Housekeeping Telecom Converter

## PACKAGE DESCRIPTION

S6 Package
6-Lead Plastic TSOT-23
(Reference LTC DWG \# 05-08-1636)

S6 TSOT-23 0302

1. DIMENSIONS ARE IN MILLIMETERS
2. DRAWING NOT TO SCALE
3. DIMENSIONS ARE INCLUSIVE OF PLATING
4. DIMENSIONS ARE EXCLUSIVE OF MOLD FLASH AND METAL BURR
5. MOLD FLASH SHALL NOT EXCEED 0.254 mm
6. JEDEC PACKAGE REFERENCE IS MO-193

## LTC3803-5

## TYPICAL APPLICATIONS

## 90\% Efficient Synchronous Flyback Converter

Synchronous Flyback $5 \mathrm{~V}_{\text {OUT }}$

## RELATGD PARTS

| PART NUMBER | DESCRIPTION | COMMENTS |
| :---: | :---: | :---: |
| LT ${ }^{\text {® }} 1425$ | Isolated Flyback Switching Regulator with No External Power Devices | No Optoisolator or "Third Winding" Required, Up to 6W Output |
| LT1725 | General Purpose Isolated Flyback Controller | No Optoisolator Required, $\mathrm{V}_{\text {IN }}$ and $\mathrm{V}_{\text {OUT }}$ Limited Only by External Power Components |
| LTC1772 | SOT-23 Constant Frequency Current Mode Step-Down DC/DC Controller | 550 kHz Switching Frequency, 2.4V to 9.8V VIN Range |
| LTC1871 | Wide Input Range, No R SENSE $^{\text {TM }}$ Current Mode Flyback, Boost and SEPIC Controller | Adjustable Switching Frequency, Programmable Undervoltage Lockout, Optional Burst Mode ${ }^{\circledR}$ Operation at Light Load |
| LTC1872 | SOT-23 Constant Frequency Current Mode Boost DC/DC Controller | 550 kHz Switching Frequency, 2.4V to 9.8V VIN Range |
| LT1950 | Current Mode PWM Controller | Controller for Forward Converters from 30W to 300W |
| LT1952 | Current Mode PWM Controller | Synchronous Controller for Forward Converters from 30W to 500W |
| LT3420 | Photoflash Capacitor Charger with Automatic Refresh | Specialized Flyback Charges High Voltage Photoflash Capacitors Quickly and Efficiently |
| LT3468/LT3468-1 | Photoflash Capacitor Charger in 5-Pin SOT-23 | Minimal Component Count, Uses Small Transformers; $\mathrm{V}_{\text {IN }}$ from 2.5 V to 16 V |
| LTC3806 | Synchronous Flyback Controller | High Efficiency (89\%); Multiple Output with Excellent Cross Regulation |
| LTC4441 | 6A N-Channel MOSFET Driver | Gate Drive Adjustable from 5V to 8V, Adjustable Blanking Prevents Ringing, 10-Lead MSSOP Package |
