LS4558N

SGS-THOMSON

30E D

DUAL HIGH PERFORMANCE OPERATIONAL AMPLIFIER

- SINGLE OR SPLIT SUPPLY OPERATION
- LOW POWER CONSUMPTION
- HIGH UNITY GAIN BANDWIDTH
- NO CROSSOVER DISTORTION
- NO POP NOISE
- SHORT-CIRCUIT PROTECTION
- HIGH CHANNEL SEPARATION

in low noise audio signal processing application. The optimized class AB output stage completely eliminates crossover, distortion, under any load conditions, has large source and sink capacity and is short-circuit protected.

DESCRIPTION

The LS4558N is a high performance dual operational amplifier with frequency and phase compensation built into the chip. The internal phase compensation allows stable operation as voltage follower in spite of its high gain-bandwidth products. The circuit presents very stable electrical characteristics over the entire supply voltage range and the specially designed input stage allow the LS4558N to be used

APPLICATION INFORMATION

Figure 10 : Mike/Line Preamplifier for Audio Mixers (0 dB to 60 dB continuously variable gain).

Note : The particular characteristics of the circuit of Figure 10 is that using a linear potentiometer, the gain is continuously variable in a logarithmic mode from 0 dB to 60 dB in the audio band.

30E D

Figure 20 : Fifth Order 3.4 KHz Low-pass Butterworth Filter.

For $f_c = 3.4$ KHz and $R_1 = R_1 = R_2 = R_3 = R_4 = 10$ K Ω , we obtain :

$$C_1 = 1.354 \cdot \frac{1}{R} \cdot \frac{1}{2\pi f_c} = 6.33 \text{ nF}$$

$$C_1 = 0.309 \cdot \frac{1}{R} \cdot \frac{1}{2\pi f_c} = 1.45 \text{ nF}$$

$$C_1 = 0.421 \cdot \frac{1}{R} \cdot \frac{1}{2\pi f_c} = 1.97 \text{ nF}$$

$$C_1 = 3.325 \cdot \frac{1}{R} \cdot \frac{1}{2\pi f_c} = 15.14 \text{ nF}$$

$$C_1 = 1.753 \cdot \frac{1}{R} \cdot \frac{1}{2\pi f_c} = 8.20 \text{ nF}$$

The attenuation of the filter is 30 dB at 6.8 KHz and better than 60 dB at 15 KHz.

Figure 21 : Six-pole 355 Hz Low-pass Filter (Chebychev type).

T-79-31

This is a 6-pole Chebychev type with ± 0.25 dB ripple in the passband. A decoupling stage is used to avoid the influence of the input impedance on the filter's characteristics. The attenuation is about 55 dB at 710 Hz and reaches 80 dB at 1065 Hz. The in band attenuation is limited in practice to the ± 0.25 dB ripple and does not exceed 0.5 dB at 0.9 fc.
