M58658P

320-BIT (20-WORD BY 16-BIT) ELECTRICALLY ALTERABLE ROM

DESCRIPTION

The M58658P is a serial input/output 320 bit electrically erasable and reprogrammable ROM organized as 20 words of 16 bits, and fabricated using MNOS technology. Data and addresses are transferred serially via a one-bit bidirectional bus.

FEATURES

- Word-by-word electrically alterable
- Non-volatile data storage 10 years (min)
- Typical power supply voltages -30V, +5V
- Number of erase-write cycles 10⁵ times (min)
- Number of read access unrefreshed. . .109 times (min)
- 5V I/O interface

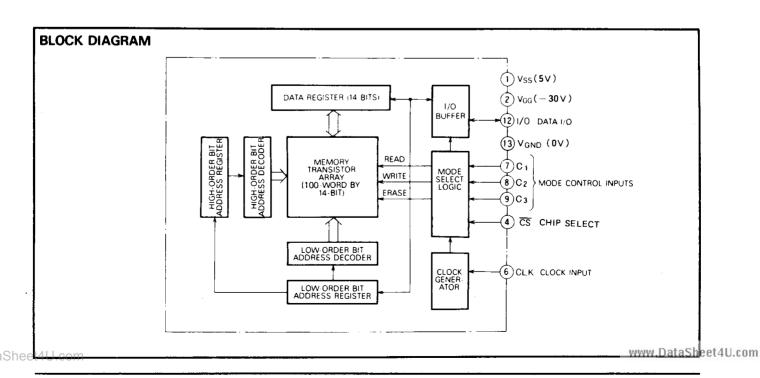

Non-volatile channel memories for electronic tuning systems and field-reprogrammable read-only memory systems

PIN CONFIGURATION (TOP VIEW) 14 V_M(NC) (5V) Vss 13 (0V) V_{GND} (-30V) VGG DATA INPUT 12 OUTPUT ĊS 11] 10 NC NC CLOCK INPUT CLK -9 **←** C3 MODE CONTROL INPUTS MODE CONTROL C1 8 **Outline 14P4** NC: NO CONNECTION

FUNCTION

The address is designated by two consecutive one-of-four-heet4U.com coded digits. Eight modes—accept address, AD accept address, accept data, shift data output, erase, write, read, and standby—are all selected by a 3-bit code applied to C_1 , C_2 , and C_3 . Data is stored by internal negative writing pulses that selectively tunnel charges into the $SiO_2-Si_3N_4$ interface of the gate insulators of the MNOS memory transistors.

PIN DESCRIPTION

Pin	Name	Functions
1/0	1/0	In the accept address AD accept address and accept data modes, used for input. In the shift data output mode, used for output. In the standby, read, erase and write modes, this pin is in a floating state
V _M	Test	Used for testing purposes only. It should be left unconnected during normal operation.
Vss	Chip substrate voltage	Normally connected to +5 V.
V _{GG}	Power supply voltage	Normally connected to ~30V.
CLK	Clock input	Required for all operating modes, when $\overline{\text{CS}}$ is low.
C ₁ ~ C ₃	Mode control input	Used to select the operation mode
V _{GND}	Ground voltage	Connected to ground (OV)
	Chip select	Used for chip selection in "L"

OPERATION MODES

et4U.com

Cı	C2	С3	Functions
н	н	Н	Standby mode. The contents of the address registers and the data register remain unchanged. The output buffer is held in the floating state.
Н	Н	L	Additional data (AD) accept address: Data presented at the I/O pin is shifted into the AD address registers one bit with each clock pulse. The address is designated by two one-of-four coded digits. 4-word address is assigned in this mode.
н	L	н	Erase mode The word stored at the addressed location is erased. The data bits after erasing are all low-level
н	L	L	Accept address mode: Data presented at the I/O pin is shifted into the address registers one bit with each clock pulse. The address is designated by two one-of-four-coded digits. 16-word address is assigned in this mode.
L	н	н	Read mode: The addressed word is read from the memory into the data register
L	н	L	Shift data output mode. The output driver is enabled and the contents of the data register are shifted to the I/O pin one bit with each clock pulse.
L	L	Н	Write mode. The data contained in the data register is written into the location designated by the address registers.
L	L	L	Accept data mode. The data register accepts serial data from the I/O pin one bit with each clock pulse. The address registers remain unchanged.

ABSOLUTE MAXIMUM RATINGS

Symbol	Parameter	Conditions	Ratings	Unit
V _G G	Supply voltage		0.3~-40	V
Vi	Input voltage	With respect to VSS	0.3~-20	V
V ₀	Output voltage		0.3~-20	Ņ
Tstg	Storage temperature		− 40 ~ 125	ν
Topr	Operating temperature		- 10 ~ 70	rc

RECOMMENDED OPERATING CONDITIONS (Ta = ~ 10 ~ 70°C, unless otherwise noted)

		Limits				
Symbol	Parameter	Min	Nom	Max	Unit

TIMING DIAGRAM

Accept Address Mode (8 clocks)

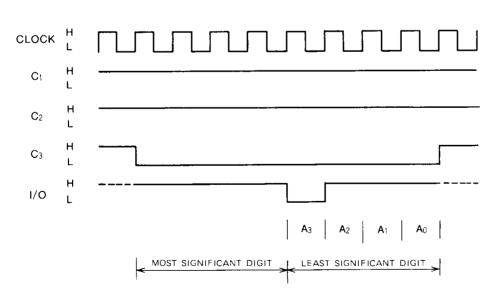

CS: L

Note 2: The addresses from A_{00} to A_{33} are designated by two one-of-four coded digits. The above figure shows designation of address A_{33} (decimal address 15).

et4U.com

DataSheet4U.com

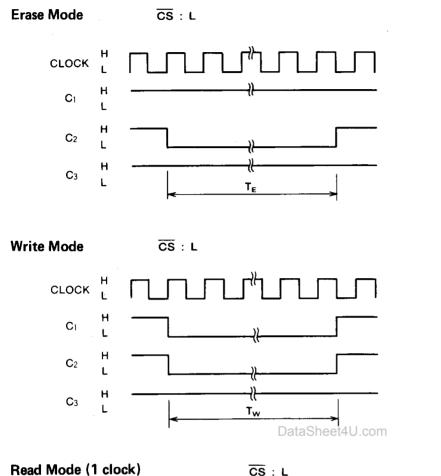

Note 3. In the AD accept address mode, the higher four are set high, and the lower four digits are designated by one of the four coded digits. This address mode allows designation of addresses from $A_{\rm o}$ to $A_{\rm 3}$. Each address has a 16 bits. The above figure shows designation of address $A_{\rm 3}$.

Power-on/off Conditions

With power-on, V_{GG} is applied after V_{SS} has been applied. With power-off, V_{SS} is cut after V_{GG} has been cut. For power-on and off, hold \overline{CS} in V_{SS} or floating state. The recommended timing chart for power-on and off is as follows.
