

## Features

- Industry Standard Architecture
- Low-Cost, Easy-To-Use Software Tools
- High Speed Electrically Erasable Programmable Logic Device
- 7.5 ns Max Propagation Delay
- Low Power ATF22V10BL - 10 mA Maximum Standby
- CMOS and TTL Compatible Inputs and Outputs
- Input and I/O Pull-Up Resistors
- Advanced Flash Technology
- Reprogrammable
- 100% Tested
- High Reliability CMOS Technology
- 20 Year Data Retention
- 100 Erase/Write Cycles
- 2,000 V ESD Protection
- 200 mA Latchup Immunity
- Full Military, Commercial and Industrial Temperature Ranges
- Dual-In-Line and Surface Mount Packages In Standard Pinouts

## Logic Diagram

## Description

The ATF22V10B and ATF22V10BL are high performance CMOS (Electrically Erasable) Programmable Logic Devices (PLDs) which utilize Atmel's proven electrically erasable Flash memory technology. Speeds down to 7.5 ns and power dissipation as low as 10 mA are offered. All speed ranges are specified over the full  $5 \text{ V} \pm 10\%$  range for military and industrial temperature ranges, and  $5\text{V} \pm 5\%$  for commercial ranges.

The ATF22V10BL provides the fastest low power CMOS PLD solution, with low DC power (5.0 mA typical). The ATF22V10BL significantly reduces total system power and enhances system reliability.

The ATF22V10B and ATF22V10BL incorporate a variable product term architecture. Each output is allocated from eight to 16 product terms, which allows highly complex logic functions to be realized.

Two additional product terms are included to provide synchronous preset and asynchronous reset. These terms are common to all 10 registers. All registers are automatically cleared upon power up.

Register Preload simplifies testing. A Security Fuse prevents unauthorized copying of programmed fuse patterns.

## Pin Configurations

Pin Name	Function
CLK	Clock
IN	Logic Inputs
I/O	Bidirectional Buffers
*	No internal Connection
VCC	+5 V Supply

## Absolute Maximum Ratings\*

Temperature Under Bias.....	-55°C to +125°C
Storage Temperature.....	-65°C to +150°C
Voltage on Any Pin with Respect to Ground.....	-2.0 V to +7.0 V <sup>(1)</sup>
Voltage on Input Pins with Respect to Ground During Programming.....	-2.0 V to +14.0 V <sup>(1)</sup>
Programming Voltage with Respect to Ground.....	-2.0 V to +14.0 V <sup>(1)</sup>

**\*NOTICE:** Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Note:

1. Minimum voltage is  $-0.6$  V dc which may undershoot to  $-2.0$  V for pulses of less than 20 ns. Maximum output pin voltage is  $V_{CC}+0.75$  V dc which may overshoot to  $+7.0$  V for pulses of less than 20 ns.

<b>Vcc Power Supply</b>	5 V ± 5%	5 V ± 10%	5 V ± 10%

## Input and I/O Pull-Ups

The ATF22V10B and ATF22V10BL have internal input and I/O active pull-up resistors. Therefore, whenever inputs or I/Os are not being driven externally, they will float to Vcc. This ensures that all logic array inputs are at known states. These are relatively weak active pull-ups that can easily be overdriven by TTL compatible drivers (see input and I/O diagrams below).

## Input Test Waveforms and Measurement Levels

## Output Test Loads:

## Pin Capacitance (f = 1 MHz, T = 25°C)<sup>(1)</sup>

	Typ	Max	Units	Conditions
C <sub>IN</sub>	5	8	pF	V <sub>IN</sub> = 0 V
C <sub>OUT</sub>	6	8	pF	V <sub>OUT</sub> = 0 V

Note: 1. Typical values for nominal supply voltage. This parameter is only sampled and is not 100% tested.

## Power Up Reset

The registers in the ATF22V10B and ATF22V10BL are designed to reset during power up. At a point delayed slightly from V<sub>CC</sub> crossing 3.8 V, all registers will be reset to the low state. The output state will depend on the polarity of the output buffer.

This feature is critical for state machine initialization. However, due to the asynchronous nature of reset and the uncertainty of how V<sub>CC</sub> actually rises in the system, the following conditions are required:

- 1) The V<sub>CC</sub> rise must be monotonic,
- 2) After reset occurs, all input and feedback setup times must be met before driving the clock pin high, and
- 3) The clock must remain stable during t<sub>PR</sub>.

Parameter	Description	Min	Typ	Max	Units
t <sub>PR</sub>	Power-Up Reset Time		600	1000	ns

## Device Programming

ATF22V10B/BL devices are programmed using an Atmel-approved logic programmer, available from a number of manufacturers. Complete programming of the device takes only a few seconds. Erasing of the device is transparent to the user, and is done automatically as part of the programming cycle.

## Security Fuse Usage

A single fuse is provided to prevent unauthorized copying of the ATF22V10B fuse patterns. Once programmed, fuse verify and preload are inhibited. However, the 64 bit User Signature remains accessible.

The security fuse should be programmed last, as its effect is immediate.
