

## 54ABT/74ABT373C

### Octal Transparent Latch with TRI-STATE® Outputs

#### General Description

The 'ABT373C consists of eight latches with TRI-STATE outputs for bus organized system applications. The flip-flops appear transparent to the data when Latch Enable (LE) is HIGH. When LE is LOW, the data that meets the setup times is latched. Data appears on the bus when the Output Enable ( $\overline{OE}$ ) is LOW. When  $\overline{OE}$  is HIGH the bus output is in the high impedance state.

#### Features

- TRI-STATE outputs for bus interfacing
- Output sink capability of 64 mA, source capability of 32 mA
- Guaranteed output skew
- Guaranteed multiple output switching specifications
- Output switching specified for both 50 pF and 250 pF loads
- Guaranteed simultaneous switching, noise level and dynamic threshold performance
- Guaranteed latchup protection
- High impedance glitch free bus loading during entire power up and power down
- Nondestructive hot insertion capability

**Ordering Code:** See Section 10

| Pin Names       | Description                      |
|-----------------|----------------------------------|
| $D_0-D_7$       | Data Inputs                      |
| LE              | Latch Enable Input (Active HIGH) |
| $\overline{OE}$ | Output Enable Input (Active LOW) |
| $O_0-O_7$       | TRI-STATE Latch Outputs          |

## Functional Description

The 'ABT373C contains eight D-type latches with TRI-STATE output buffers. When the Latch Enable (LE) input is HIGH, data on the  $D_n$  inputs enters the latches. In this condition the latches are transparent, i.e., a latch output will change state each time its D input changes. When LE is LOW, the latches store the information that was present on the D inputs a setup time preceding the HIGH-to-LOW transition of LE. The TRI-STATE buffers are controlled by the Output Enable ( $\overline{OE}$ ) input. When  $\overline{OE}$  is LOW, the buffers are in the bi-state mode. When  $\overline{OE}$  is HIGH the buffers are in the high impedance mode but this does not interfere with entering new data into the latches.

## Truth Table

| Inputs |                 |       | Output            |
|--------|-----------------|-------|-------------------|
| LE     | $\overline{OE}$ | $D_n$ | $O_n$             |
| H      | L               | H     | H                 |
| H      | L               | L     | L                 |
| L      | L               | X     | $O_n$ (no change) |
| X      | H               | X     | Z                 |

H = HIGH Voltage Level  
 L = LOW Voltage Level  
 X = Immaterial  
 Z = High Impedance State

## Logic Diagram

DC Latchup Source Current:     OE Pin     -150 mA  
 (Across Comm Operating Range) Other Pins -500 mA

Over Voltage Latchup (I/O)     10V

**Note 1:** Absolute maximum ratings are values beyond which the device may be damaged or have its useful life impaired. Functional operation under these conditions is not implied.

**Note 2:** Either voltage limit or current limit is sufficient to protect inputs.

**Recommended Operating Conditions**

|                              |                 |
|------------------------------|-----------------|
| Free Air Ambient Temperature |                 |
| Military                     | -55°C to +125°C |
| Commercial                   | -40°C to +85°C  |
| Supply Voltage               |                 |
| Military                     | +4.5V to +5.5V  |
| Commercial                   | +4.5V to +5.5V  |
| Minimum Input Edge Rate      | (ΔV/Δt)         |
| Data Input                   | 50 mV/ns        |
| Enable Input                 | 20 mV/ns        |

**Note 4:** This specification is guaranteed but not tested. The limits apply to propagation delays for all paths described switching in phase (i.e., all LOW-to-HIGH, HIGH-to-LOW, etc.)

**Note 5:** This specification is guaranteed but not tested. The limits represent propagation delay with 250 pF load capacitors in place of the 50 pF load capacitors in the standard AC load. This specification pertains to single output switching only.

**Note 6:** This specification is guaranteed but not tested. The limits represent propagation delays for all paths described switching in phase (i.e., all LOW-to-HIGH, HIGH-to-LOW, etc.) with 250 pF load capacitors in place of the 50 pF load capacitors in the standard AC load.

**Note 7:** The TRI-STATE delay times are dominated by the RC network (500Ω, 250 pF) on the output and has been excluded from the datasheet.

**Skew:** See Section 2 (SOIC Package)

**Note 1:** Skew is defined as the absolute value of the difference between the actual propagation delays for any two separate outputs of the same device. The specification applies to any outputs switching HIGH to LOW ( $t_{OSHL}$ ), LOW to HIGH ( $t_{OSLH}$ ), or any combination switching LOW to HIGH and/or HIGH to LOW ( $t_{OST}$ ). This specification is guaranteed but not tested.

**Note 2:** Propagation delay variation for a given set of conditions (i.e., temperature and  $V_{CC}$ ) from device to device. This specification is guaranteed but not tested.

**Note 3:** This specification is guaranteed but not tested. The limits apply to propagation delays for all paths described switching in phase (i.e., all LOW-to-HIGH, HIGH-to-LOW, etc.).

**Note 4:** This specification is guaranteed but not tested. The limits represent propagation delays with 250 pF load capacitors in place of the 50 pF load capacitors in the standard AC load.

**Note 5:** This describes the difference between the delay of the LOW-to-HIGH and the HIGH-to-LOW transition on the same pin. It is measured across all the outputs (drivers) on the same chip, the worst (largest delta) number is the guaranteed specification. This specification is guaranteed but not tested.

# Capacitance

| Symbol             | Parameter          | Typ | Units | Conditions<br>( $T_A = 25^\circ\text{C}$ ) |
|--------------------|--------------------|-----|-------|--------------------------------------------|
| $C_{IN}$           | Input Capacitance  | 5   | pF    | $V_{CC} = 0\text{V}$                       |
| $C_{OUT}$ (Note 1) | Output Capacitance | 9   | pF    | $V_{CC} = 5.0\text{V}$                     |

Note 1:  $C_{OUT}$  is measured at frequency  $f = 1\text{ MHz}$ , per MIL-STD-883B, Method 3012
