

## BIT MAP LCD DRIVER

## ■ GENERAL DESCRIPTION

The NJU6675 is a bit map LCD driver to display graphics or characters.

It contains 5,568 bits display data RAM, microprocessor interface circuits, instruction decoder, 96-segment and 58-common drivers.

The bit image display data is transferred to the display data RAM by serial or 8-bit parallel interface.

The NJU6675 displays 58 x 96 dots graphics or 6-character 3-line by 16 x 16 dots character.

The operating voltage from 2.4V to 3.3V and low operating current are useful to apply small size battery operating items.

The build-in Electrical Variable Resistance is very precision.

## ■ PACKAGE OUTLINE

NJU6675CH

## ■ FEATURES

- Direct Correspondence between Display Data RAM and LCD Pixel
- Display Data RAM - 5,568 bits
- 135 LCD Drivers - 58-common and 96-segment
- Direct Microprocessor Interface for both of 68 and 80 type MPU
- Serial Interface
- Duty Ratio ; 1/58 Duty
- Useful Instruction Set
  - Display Data Read/Write, Display ON/OFF Cont, Inverse Display, Page Address Set, Column Address Set, Status Read, All On/Off, Read Modify Write, Power Saving, etc.
- Power Supply Circuits for LCD Incorporated
  - Step up Circuits, Regulator, Voltage Follower x 4
- Precision Electrical Variable Resistance
- Low Power Consumption
- Operating Voltage --- 2.4V to 3.3V
- LCD Driving Voltage --- 6.0V to 10V
- Package Outline --- TCP / Bumped Chip
- C-MOS Technology

Mar.1999

Ver.1

## ■ PAD LOCATION

Chip Center	X=0um, Y=0um
Chip Size	X=4.84mm, Y=4.2mm
Chip Thickness	400um ± 30um
Bump Size	53um x 113um
PAD Pitch	70um MIN.
Bump Height	25um TYP.
Bump Material	Au

NJU6675

## ■ Functional Description

### (1) Description for each blocks

#### (1-1) Busy Flag (BF)

While the internal circuits are operating, the busy flag (BF) is "1", and any instruction excepting for the status read are inhibited.

The busy flag goes to "1" from D7 terminal when status read instruction is executed.

When enough cycle time over than tCYC indicated in "BUS TIMING CHARACTERISTICS" is ensure, no need to check the busy flag for reduction of the MPU loaded.

#### (1-2) Line Counter

The Line Counter generates the line address of display data RAM by the count up operation synchronizing the common cycle after the operation at the status change of internal FR signal.

#### (1-3) Column Address Counter

The column address counter is 8-bit pre-settable counter addressing the column address of display data RAM as shown in Fig. 1. It is incremented (+1) up to (60)H by the Display Data Read/Write instruction execution. It stops the count up operation at (60)H, and it does not count up non existing address area over than (60)H by the count lock function. This count lock is released by new column address set.

The column address counter is independent of the Page Register.

By the Address Inverse Instruction, the column address decoder inverse the column address of Display Data RAM corresponding to the Segment Driver.

#### (1-4) Page Register

The page register gives a page address of Display Data RAM as shown in Fig. 1. When the MPU accesses the data with the page change, the page address set instruction is required. Page address "7" is D<sub>0</sub>,D<sub>1</sub> is valid.

#### (1-5) Display Data RAM

Display Data RAM is the bit map RAM consisting of 5,568 bits to memorize the display data corresponding to each pixel of LCD panel. The each bit in the Display Data RAM corresponds to the each pixel of the LCD panel and controls the display by following bit data.

When Normal Display : On="1" , Off="0"

When Inverse Display : On="0" , Off="1"

The Display Data RAM outputs 96-bit parallel data in the area addressed by the line counter, and these data are set into the Display Data Latch.

The access operation from MPU to the display data RAM and the data output from the display data RAM are so controlled to operate independently that the data rewriting does not influence with any malfunctions to the display. The relation between column address and segment output can inverse by the Address Inverse Instruction ADC as shown in Fig. 1.

### (1-6) Common Driver Assignment

The scanning order can be assigned by setting A3 of the Output Assignment Register as shown Table 1.

Table 1

Register	COM Outputs Terminals					
A3	PAD No.	34	62	159	187	
	Pin name	C0	C28	C57	C29	
0	→	COM0	→	COM28		
1	→	COM57	←	COM29		
				COM0	→	COM28

### (1-7) Reset Circuit

Reset circuit operates the following initializations when the condition of  $\overline{\text{RES}}$  terminal goes to "L" level.

#### Initialization

- 1 Display Off
- 2 Normal Display (Non-inverse display)
- 3 ADC Select : Normal (ADC Instruction D0="0")
- 4 Read Modify Write Mode Off
- 5 Internal Power supply (Step up) circuits Off
- 6 Clear the serial interface register
- 7 Set the address (00)H to the Column Address Counter
- 8 Set the page "0" to the Page Address Register
- 9 Select the D3 of the Output Assignment Register to "0"
- 10 Set the EVR register to (00)H

The  $\overline{\text{RES}}$  terminal should be connected to the Reset terminal of MPU for the initialization at the mean time with MPU as shown "MPU Interface Example". The period of  $\overline{\text{RES}}$  signal requires over than  $10 \mu\text{s}$   $\overline{\text{RES}}$ ="L" level input as shown in "Electrical Characteristics". After  $1 \mu\text{s}$  from the rise edge of  $\overline{\text{RES}}$  signal, the operation goes to normal.

When the internal LCD power supply is not used, the external LCD power supply into the NJU6675 must be turned on during  $\overline{\text{RES}}$  = "L". Although the condition of  $\overline{\text{RES}}$ ="L" clear each registers and initialize as above, the oscillation circuit and the output terminal conditions (D0 to D7) are not influenced. The initialization must be performed using  $\overline{\text{RES}}$  terminal at the power on, to prevent hung up or any incorrect operations. The reset Instruction performs the initialization procedures from No.7 to No.10 as shown in above.

Note) The noise into the  $\overline{\text{RES}}$  terminal should be eliminated to avoid error on the application with the careful design.

## (1-8) LCD Driving

### (a) LCD Driving Circuits

LCD driving circuits are consisted of 154 multiplexers which operate as 96 Segment drivers and 58 Common drivers. 58 Common drivers with the shift register scan the common display signal. The combination of the Display data, COM scan signal and FR signal forms the LCD driving output voltage. The output wave form is shown in the Fig. 7.

### (b) Display Data Latch Circuits

Display Data Latch stores 96-bit display data temporality which is output to LCD driver circuits at a common cycle from Display Data RAM addressed by Line Counter. The instructions of Display On/Off, Display inverse On/Off control only the data in Display Data Latch, therefore, the data in the Display Data RAM is not changed.

### (c) Line Counter and Latch signal of Latch Circuits

The clock to Line Counter and latch signal to the Latch Circuits are generated from the internal display clock (CL). The line address of Display Data RAM is renewed synchronizing with display clock (CL). 96 bits display data are latched in display latch circuits synchronizing with display clock, and then output to the LCD driving circuits. The display data transfer to the LCD driving circuits is executed independently with RAM access by the MPU.

### (d) Display Timing Generator

Display Timing Generator generates the timing signal for the display system by combination of the master clock CL and Driving Signal FR (refer to Fig.2). The Frame Signal FR and LCD alternative signal generate LCD driving waveform of the two frame alternative driving method.

### (e) Common Timing Generation

The common timing is generated by display clock CL (refer to Fig.2).

Fig.2 Waveform of Display Timing

**(f) Oscillation Circuits**

The Oscillation Circuit is a low power CR oscillator incorporating with a Resistor and a Capacitor. It generates clocks for display timing signal source and the clock for step up circuits for LCD driving. The oscillation circuit output frequency is divided by 4 which is used as display clock CL.

**(g) Power Supply Circuits**

Internal Power Supply Circuit generate the High voltage and Bias voltage for the LCD. The power Supply Circuits consists of Step up (Tripler or Doubler) Circuits, Regulator Circuits, and Voltage Followers. The internal Power Supply is designed for small size LCD panel, therefore it is not suitable for the large size LCD panel application. If the contrast is not good in the large size LCD panel application, please supply the external.

The suitable values of the capacitors connecting to the V1 to V5 terminals and the step up circuit, and the feedback resistors for V5 operational amplifier depend on the LCD panel. And the power consumption with the LCD panel is depending on the display pattern. Please evaluate with actual LCD module.

The operation of internal Power Supply Circuits is controlled by the Internal Power Supply On/Off Instruction. When the Internal Power Supply Off Instruction is executed, all of the step up circuits, regulator circuits, voltage follower circuits are turned off. In this time, the bias voltage of V1, V2, V3, V4, and V5 for the LCD should be supplied from outside, terminals C1+, C1-, C2+, C2-, and VR should be open. The status of internal power supply is selected by T1 and T2 terminal. Furthermore the external power supply operates with some of internal power supply function.

Table.3

(\* : Don't Care)

T1	T2	Step up	Voltage Adj.	Buffer (V/F)	Ext. Power Supply	C1+,C1-,C2+,C2-	VR Term.
L	*	O	O	O	-		
H	L	x	O	O	VOUT	OPEN	
H	H	x	x	O	V5, VOUT	OPEN	OPEN

When (T1, T2)=(H, L), C1+, C1-, C2+, C2- terminals for voltage booster circuits are open because the step up circuits doesn't operate. Therefore the LCD driving voltage to the VOUT terminal should be supplied from outside. When (T1, T2)=(H, H), terminals for step up circuits and VR are open, because the Step up circuits and Voltage adjust circuits do not operate.

## ○ Power Supply applications

(1) External power supply operation.

(2) Internal power supply operation.

(Voltage Booster, Voltage Adj., Buffer(V/F))

Internal power supply ON (instruction) (T1,T2)=(L,L)

(3) External power supply operation with Voltage Adjustment, Buffer(V/F)

Internal power supply ON (Instruction) (T1,T2) = (H,L)

(4) External power supply operation adjusted Voltage to V5.

Internal power supply ON (Instruction) (T1,T2) =(H,H)

\* ⊗ : These switches should be open during the power save mode.

## (2) Instruction

The NJU6675 distinguishes the signal on the data bus by combination of A0,  $\overline{RD}$  and  $\overline{WR}$ . The decode of the instruction and execution are performed only depend on the internal timing only neither the external clock. In case of serial interface, the data input as MSB first serially.

The Table. 4 shows the instruction codes of the NJU6675.

Table 4. Instruction Code

Instruction		Code										Description		
		A0	$\overline{RD}$	$\overline{WR}$	D7	D6	D5	D4	D3	D2	D1		D0	
(1)	Display ON/OFF	0	1	0	1	0	1	0	1	1	1	0	1	LCD Display ON/OFF 0:OFF 1:ON
(2)	Page Address Set	0	1	0	1	0	1	1	*	Page Address			Set the page of DD RAM to the Page Address Register	
(3)	Column Address Set High Order 3bits	0	1	0	0	0	0	1	0	High Order Column Add.			Set the Higher order 3 bits Column Address to the Reg.	
(4)	Column Address Set Lower Order 4bits	0	1	0	0	0	0	0	Lower Order Column Add.			Set the Lower order 4 bits Column Address to the Reg.		
(5)	Status Read	0	0	1	Status				0	0	0	0	Read out the internal Status	
(6)	Write Display Data	1	1	0	Write Data							Write the data into the Display Data RAM		
(7)	Read Display Data	1	0	1	Read Data							Read the data from the Display Data RAM		
(8)	ADC Select	0	1	0	1	0	1	0	0	0	0	0	1	Set the DD RAM vs Segment 0:Normal 1:Inverse
(9)	Normal or Inverse of ON/OFF Set	0	1	0	1	0	1	0	0	1	1	0	1	Inverse the ON and OFF Display 0:Normal 1:Inverse

(17)	EVR Register Set	0	1	0	1	0	0	0	Setting Data			Set the V5 output level to the EVR register		
(18)	Power Save (Dual Command)	0	1	0	1	0	1	0	1	1	1	0	0	Set the Power Save Mode
		0	1	0	1	0	1	0	0	1	0	1	1	

(\*:Don't Care)

### (3) Explanation of Instruction Code

#### (a) Display On/Off

This instruction executes whole display On/Off without relationship of the data in the Display Data RAM and internal conditions.

A0	$\overline{RD}$	$\overline{WR}$	D7	D6	D5	D4	D3	D2	D1	D0
0	1	0	1	0	1	0	1	1	1	D

D 0:Display Off

1:Display On

#### (b) Page Address Set

When MPU accesses the Display Data RAM, the page address must be selected before the data writing. The access to the Display Data RAM is available by the page and column address set (Refer the Fig. 1.). The page address change does not influence with the display.

A0	$\overline{RD}$	$\overline{WR}$	D7	D6	D5	D4	D3	D2	D1	D0	
0	1	0	1	0	1	1	*	A <sub>2</sub>	A <sub>1</sub>	A <sub>0</sub>	(*:Don't care)

A <sub>2</sub>	A <sub>1</sub>	A <sub>0</sub>	Page
0	0	0	0
0	0	1	1
0	1	0	2
0	1	1	3
1	0	0	4
1	0	1	5
1	1	0	6
1	1	1	7

#### (c) Column Address

When MPU accesses the Display Data RAM, the page address set(refer(b)) and column address set are required before the data writing. The column address set requires twice address set which are higher order 3 bits address set and lower order 4 bits. When the MPU accesses the Display Data RAM sequentially, the column address is increase one by one automatically, therefore, the MPU can access only the data sequentially without address set.

After writing 1page data ,page address setting is required due to page address doesn't increase automatically. The increment of the column address is stopped at the address of (60)H automatically, and the page address is not changed even if the column address increase to (60)H and stop. In this time the page address is not changed.

A0	$\overline{RD}$	$\overline{WR}$	D7	D6	D5	D4	D3	D2	D1	D0	
0	1	0	0	0	0	1	*	A <sub>6</sub>	A <sub>5</sub>	A <sub>4</sub>	Higher Order

0	1	0	0	0	0	0	A <sub>3</sub>	A <sub>2</sub>	A <sub>1</sub>	A <sub>0</sub>	Lower Order
---	---	---	---	---	---	---	----------------	----------------	----------------	----------------	-------------

A <sub>6</sub>	A <sub>5</sub>	A <sub>4</sub>	A <sub>3</sub>	A <sub>2</sub>	A <sub>1</sub>	A <sub>0</sub>	Column Address
0	0	0	0	0	0	0	0
0	0	0	0	0	0	1	1
			:				:
			:				:
1	0	1	1	1	1	1	5F

**(d) Status Read**

This instruction reads out the internal status of "BUSY", "ADC", "ON/OFF" and "RESET".

A0	$\overline{\text{RD}}$	$\frac{\text{R/W}}{\text{WR}}$	D7	D6	D5	D4	D3	D2	D1	D0
0	0	1	BUSY	ADC	ON/OFF	RESET	0	0	0	0

**BUSY** : BUSY=1 indicate the operating or the Reset cycle.

The instruction can be input after the BUSY status change to "0".

**ADC** : Indicate the output correspondence of column (segment) address and segment driver.

0 : Counterclockwise Output (Inverse) Column Address 95-n <----> Segment Driver n

1 : Clockwise Output (Normal) Column Address n <----> Segment Driver n

(Note) The data "0=Inverse" and "1=Normal" of ADC is inverted with the ADC select Instruction of "1=Inverse" and "0=Normal".

**ON/OFF** : Indicate the whole display On/Off status.

0 : Whole Display "On"

1 : Whole Display "Off"

(Note) The data "0=On" and "1=Off" of Display On/Off status read out is inverted with the Display On/Off instruction data of "1=On" and "0=Off".

**RESET** : Indicate the initializing period by  $\overline{\text{RES}}$  signal or reset instruction.

0 : -

1 : Initialization Period

**(e) Write Display Data**

This instruction writes the 8-bit data on the data bus into the Display Data RAM. The column address increases "1" automatically after data writing, therefore, the MPU can write the 8-bit data into the Display Data RAM continuously without any address setting after the start address setting.

A0	$\overline{\text{RD}}$	$\frac{\text{R/W}}{\text{WR}}$	D7	D6	D5	D4	D3	D2	D1	D0
1	1	0	WRITE DATA							

**(f) Read Display Data**

This instruction reads out the 8-bit data from Display Data RAM which addressed by the column and page address. The column address increase "1" automatically after data reading out, therefore, the MPU can read out the 8-bit data from the Display Data RAM without any address setting after the start address setting. One time of dummy read must operate after column address set as the explanation in "(5-5) Access to the Display Data RAM and Internal Register". In the serial interface mode, the display data is not read out.

A0	$\overline{\text{RD}}$	$\frac{\text{R/W}}{\text{WR}}$	D7	D6	D5	D4	D3	D2	D1	D0
1	0	1	READ DATA							

### (g) ADC Select

This instruction set the correspondence of column address in the Display Data RAM and segment driver output. (See Fig. 1.) By this instruction, the order of segment output can be changed by the software, and no restriction of the LSI placement against the LCD panel.

A0	$\overline{RD}$	$\frac{R/W}{WR}$	D7	D6	D5	D4	D3	D2	D1	D0
0	1	0	1	0	1	0	0	0	0	D

D 0 : Clockwise Output (Normal)

1 : Counterclockwise Output (Inverse)

### (h) Normal or Inverse On/Off Set

This instruction changes the condition of display turn on and off as normal or inverse. The contents of Display Data RAM is not changed by this instruction execution.

A0	$\overline{RD}$	$\frac{R/W}{WR}$	D7	D6	D5	D4	D3	D2	D1	D0
0	1	0	1	0	1	0	0	1	1	D

D 0 : Normal RAM data "1" correspond to "On"

1 : Inverse RAM data "0" correspond to "On"

### (i) Whole Display On

This instruction turns on the all pixels independent of the contents of the Display Data RAM. In this time, the contents of Display Data RAM is not changed and kept. This instruction takes precedence over the "Normal or Inverse On/Off Set Instruction".

A0	$\overline{RD}$	$\frac{R/W}{WR}$	D7	D6	D5	D4	D3	D2	D1	D0
0	1	0	1	0	1	0	0	1	0	D

D 0 : Normal Display

1 : Whole Display turn on

When Whole Display On Instruction is executed in the Display Off status, the internal circuits go to the power save mode (refer to the (s) Power Save).

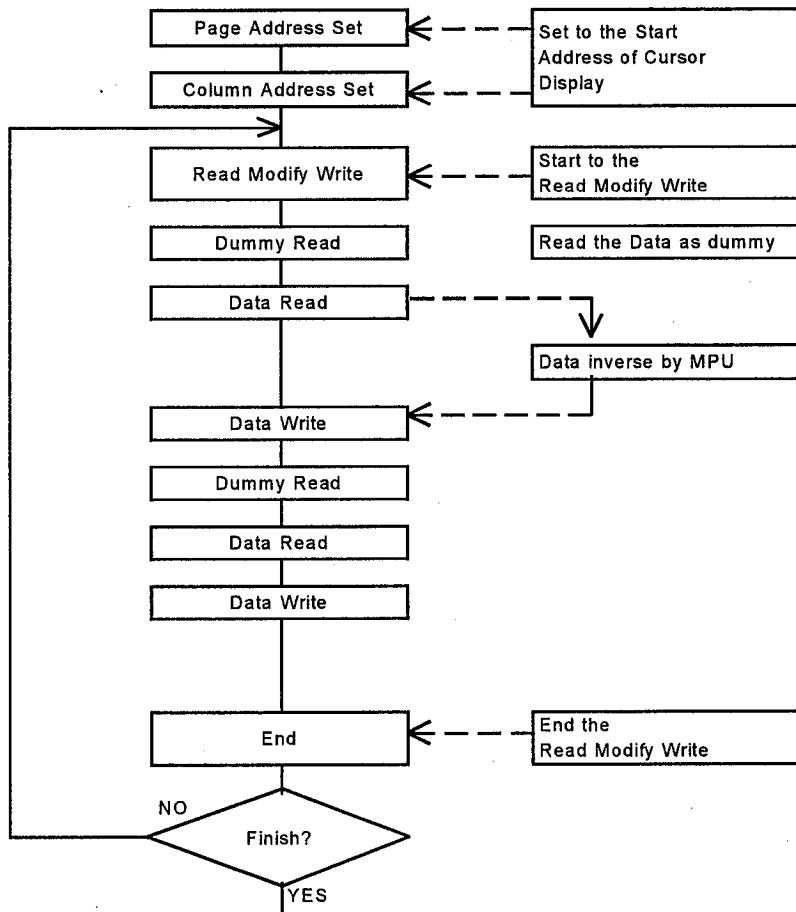

**(j) Read Modify Write**

This instruction sets the Read Modify Write Mode for the column address increment control. In mode of the Read Modify Mode Write, the column address increases "1" automatically when the Display Data Write Instruction is executed, but the address does not change when the Display Data Read Instruction is executed. This status is continued until End instruction execution. When the End instruction is input, the column address goes back to the start address before the Read Modify Write instruction input. This function reduces the load of MPU for repeating the display data change in the fixed area (ex. cursor blink).

A0	$\overline{\text{RD}}$	$\frac{\text{R/W}}{\text{WR}}$	D7	D6	D5	D4	D3	D2	D1	D0
0	1	0	1	1	1	0	0	0	0	0

Note) In mode of the Read Modify Write, any instructions except for Column Address Set can execute.

**(k) Sequence of cursor blink display**

**(l) End**

This instruction release the Read Modify Write mode and the column address back to the address where the read modify write mode setting.

A0	$\overline{RD}$	R/W WR	D7	D6	D5	D4	D3	D2	D1	D0
0	1	0	1	1	1	0	1	1	1	0

**(m) Reset**

This instruction executes the following initialization.

Initialization

- 1 Set the Address (00)H into the Column Address Counter.
- 2 Set the page "0" into the Page Address Register.
- 3 Select the D3 of the Output Assignment Register to "0".
- 4 Set 0 to the EVR Register to (00)H.

In this time, the Display Data RAM is not influenced.

A0	$\overline{RD}$	R/W WR	D7	D6	D5	D4	D3	D2	D1	D0
0	1	0	1	1	1	0	0	0	1	0

The reset signal input to the  $\overline{RES}$  terminal (hardware reset) must be input for the power on initialization. Reset instruction does not perform completely instead of hardware reset using the  $\overline{RES}$  terminal.

**(n) Output Assignment Register**

This instruction sets the common driver scanning order.

A0	$\overline{RD}$	R/W WR	D7	D6	D5	D4	D3	D2	D1	D0
0	1	0	1	1	0	0	A3	*	*	*

(\*:Don't care)

A3 : Set the scanning order. (Refer to 1-6)

**(o) Internal Power Supply**

This instruction set the condition of internal Power Supply On/Off. Step up circuits, Voltage Regulator and Voltage Follower operate at On. To operate the step up circuits, the oscillation circuits must be operating.

A0	$\overline{RD}$	R/W WR	D7	D6	D5	D4	D3	D2	D1	D0
0	1	0	0	0	1	0	0	1	0	D

D 0 : Internal Power Supply Off

1 : Internal Power Supply On

The internal Power Supply must be Off when external power supply using.

(p) LCD Driving Voltage Set

This instruction controls LCD driving waveform output through the COM/SEG terminals.

A0	$\overline{RD}$	$\frac{R/W}{WR}$	D7	D6	D5	D4	D3	D2	D1	D0
0	1	0	1	1	1	0	1	1	0	1

The NJU6675 contains low power LCD driving voltage generator circuit reducing own operation current. Therefore, it requires the following sequence procedures at power on for power source stabilized operation.

● LCD driving power supply ON/OFF sequences

The following sequences are required when the power supply is turned On/Off.

When the power supply is turned on again after the turn off (by the power save instruction), the power save release sequence (s) is required.

\*1 This instruction is required in both cases of the internal and external power supply.

Until "LCD driving voltage Set" execution, NJU6675 operating current is higher than usual state and all COM/SEG terminals output VDD level continuously.

\*2 The wait time depends on the C3 to C7, COUT capacitors (refer(4) (d)Fig.4), VDD and VLCD voltage.

Therefore it requires the actual evaluation using the LCD module to get the correct time. (Refer to the following graph.)

### (q) EVR Register Set

This instruction controls voltage adjustment circuits of internal LCD power supply and changes LCD driving voltage "V5". Finally, it adjusts the contrast of LCD display. By setting a data into EVR register. V5 output voltage selects one condition out of 16-voltage conditions. The range of V5 voltage is adjusted by setting external resistors as mentioned in "(4)(b) Voltage Adjust Circuits".

A0	$\overline{RD}$	R/W WR	D7	D6	D5	D4	D3	D2	D1	D0
0	1	0	1	0	0	0	A3	A2	A1	A0

A3	A2	A1	A0	VLCD
0	0	0	0	Low
		:		:
		:		:
1	1	1	1	High

VLCD=VDD-V5  
When EVR doesn't use, set the EVR register to (0,0,0,0).

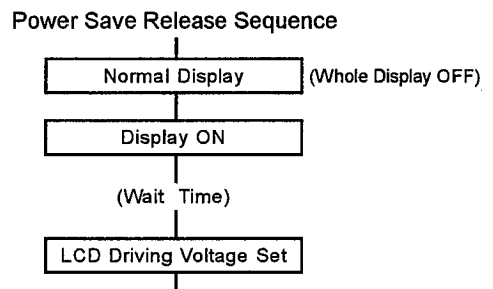

### (r) Power Save(Dual Command)

When both of Display Off and Whole Display On are executed, the internal circuits go to the power save mode and the operating current is reduced as same as the stand by current.

The internal status in the Power Save Mode is shown in follows;

- 1 Stop the Oscillation Circuits and Internal Power Supply Circuits operation.
- 2 Stop the LCD driving. Segment and Common drivers output VDD level.
- 3 Keep the display data and operating mode just before the power save mode.
- 4 All of LCD driving bias voltage fix to the VDD level.

The power save and its release perform according to the following sequences.

\*1 In the power save sequence, the power save mode is started after the second instruction "whole Display ON".

\*2 In the power save release sequence, the power save mode is released after the Normal Display instruction (Whole display OFF).

The instruction of display ON is input at any timing after the instruction of normal display in power save release sequence.

\*3 Until "LCD driving voltage set to ON" execution, NJU6675 operating current is higher than usual state and all COM/SEG terminals output VDD level continuously.

\*4 In case of the external power supply for LCD driving, it should be turned off and made condition like as disconnection or connection to VDD before the power save mode or at the same time. In this time, VOUT terminal should be made condition like as disconnection or connection to the lowest voltage of the system. (V5 level from the external power supply.)

## (4) Internal Power Supply

### (a) Voltage tripler

Three times negative voltage ( $V_{DD}$  common) of the voltage  $V_{DD}-V_{SS}$  is output from  $V_{OUT}$  terminal when connecting three capacitor between  $C1^+$  and  $C1^-$ ,  $C2^+$  and  $C2^-$ ,  $V_{SS}$  and  $V_{OUT}$ . In case of the voltage doubler operation, connect the two capacitor between  $C2^+$  and  $C2^-$ ,  $V_{SS}$  and  $V_{OUT}$ , then connect the  $C1^+$  and  $C2^+$  terminals. Step up circuits like as Voltage Tripler or Doubler using a oscillation circuits output as its clock signal, therefore, the oscillation circuits operation is required when step up operation. The voltage relation regarding the step up circuits is shown in below. When voltage tripler operation, the operation voltage  $V_{DD}$  should be less than 3.3V.

Voltage relation in Doubler

Voltage relation in Tripler

### (b) Voltage Adjust Circuits

The step up voltage of  $V_{OUT}$  output from  $V_5$  through the voltage adjust circuits for LCD driving. The output voltage of  $V_5$  is adjusted by changing the  $R_a$  and  $R_b$  within the range of  $|V_5| < |V_{OUT}|$ . The output voltage is calculated by the following formula.

$$V_{LCD} = V_{DD}-V_5 = (1+R_b/R_a) \times V_{REG} \quad \text{--- 1}$$

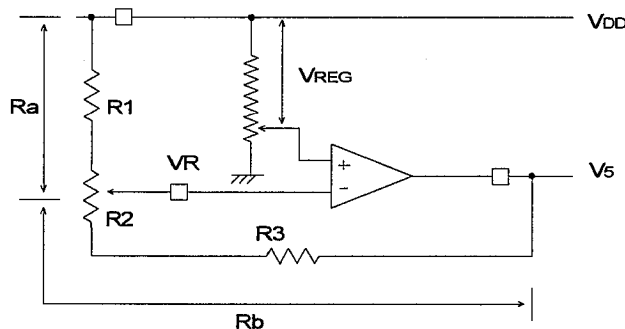

Fig.3

The voltage of  $V_{REG}$  is a standard voltage produced from built-in bleeder resistance. And  $V_{REG}$  is possible to be fine-adjusted by EVR functions mentioned in (c).

For fine-adjustment of  $V_5$ ,  $R_2$  as variable resistor,  $R_1$  and  $R_3$  as fixed constant should be connected to  $V_{DD}$  terminal,  $V_R$  and  $V_5$ , as shown in Fig3.

#### [ Design example for $R_1$ , $R_2$ and $R_3$ / Reference ]

- $R_1+R_2+R_3=5M\Omega$  (Determined by the current flown between  $V_{DD}-V_5$ )
- Variable voltage range by the  $R_2$ . -3V to -4.5V ( $V_{LCD}=V_{DD}-V_5 \rightarrow 6.0V$  to 7.5V)  
(Determined by the LCD electrical characteristics)
- $V_{REG}=3V$ (In case of EVR=(0F)H)
- $R_1$ ,  $R_2$  and  $R_3$  are calculated by above conditions and the formula of 1 to mentioned below;  
 $R_1=2.0M\Omega$ ,  $R_2=0.5M\Omega$ ,  $R_3=2.5M\Omega$

\* If the power supply voltage between  $V_{DD}$  and  $V_{SS}$  changes,  $V_5$  changes too. Therefore the power supply voltage should be stabilized for  $V_5$  stable operation.

(c) Contrast Adjustment by using the EVR function

The EVR controls voltage of VREG by instruction and changes voltage of V5.

As result, LCD display contrast is adjusted by V5. The EVR selects a voltage of VREG in the following 16 conditions by setting 4bits data into the EVR register.

In case of EVR operation, T1 terminal and T2 require to set couples of value as (L,L), (L,H) and (H,L) excepting for (H,H) and the internal power supply must turn on by instruction.

EVR register		VREG [V]	VLCD
(00)H	(0,0,0,0)	$(135/150) \times (V_{DD} - V_{SS})$	Low
(01)H	(0,0,0,1)	$(136/150) \times (V_{DD} - V_{SS})$	:
(02)H	(0,0,1,0)	$(137/150) \times (V_{DD} - V_{SS})$	:
:	:	:	:
:	:	:	:

● Adjustable range of the LCD driving voltage by EVR function

The adjustable range is decided by the power supply voltage VDD and the ratio of external resistors Ra and Rb.  
[ Design example for the adjustable range / Reference ]

- Condition VDD=3.0V, VSS=0V

Ra=1MΩ, Rb=1MΩ (Ra:Rb=1:1)

The adjustable range and the step voltage are calculated as follows in the above condition.

In case of setting (00)H in the EVR register,

$$\begin{aligned} V_{LCD} &= ((R_a + R_b) / R_a) \times V_{REG} \\ &= (2/1) \times [(135/150) \times 3.0] \\ &= 5.4V \end{aligned}$$

In case of setting (0F)H in the EVR register,

$$\begin{aligned} V_{LCD} &= ((R_a + R_b) / R_a) \times V_{REG} \\ &= (2/1) \times [(150/150) \times 3.0] \\ &= 6.0V \end{aligned}$$

	Min.(00)H	Max.(0F)H
Adjustable Range	5.4	6.0 [V]
Step Voltage	40	[mV]

\*) The VLCD operating temperature. Please refer to the following graphs.

(conditions)  $V_{DD} = 3V$

$R_a = 1M\Omega$ ,  $R_b = 1M\Omega$  ( $R_a : R_b = 1 : 1$ )

Voltage tripler

VLCD vs. Temperature (Typical performance)

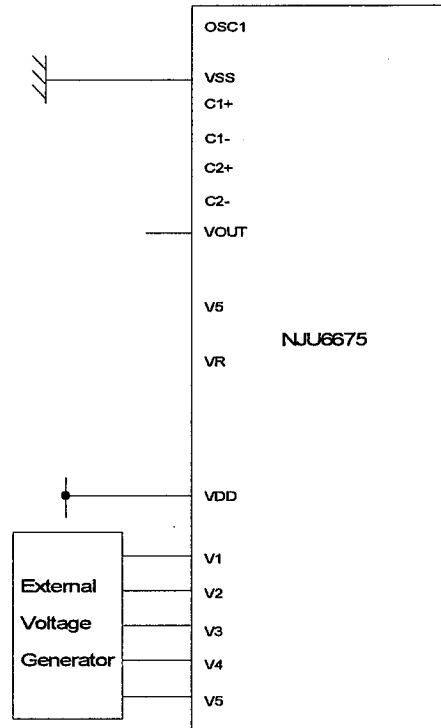

### (d) LCD Driving Voltage Generation Circuits

The LCD driving bias voltage of V1,V2,V3,V4 are generated internally by dividing the V5 voltage with the internal bleeder resistance. And it is supplied to the LCD driving circuits after the impedance conversion with voltage follower circuit.

As shown in Fig. 4, Five capacitors are required to connect to each LCD driving voltage terminal for voltage stabilizing. And the value of capacitors C3, C4, C5, C6 and C7 are determined depending on the actual LCD panel display evaluation.

Using the internal Power Supply

Using the external Power Supply

Reference set up value

$$V_{LCD} = V_{DD} - V_5 \approx 6.0 \text{ to } 7.5V$$

Item	Value
COUT	4.7 to 10uF
C1,C2	4.7 to 10uF
C3 to C7	0.1 to 0.47uF
R1	2.0MΩ
R2	0.5MΩ
R3	2.5MΩ

Fig.4

\*1 Short wiring or sealed wiring to the VR terminal is required due to the high impedance of VR terminal.

\*2 Following connection of VOUT is required when external power supply using.

When  $V_{SS} > V_5$  ---  $V_{OUT} = V_5$

When  $V_{SS} \leq V_5$  ---  $V_{OUT} = V_{SS}$

## (5) MPU Interface

### (5-1) Interface type selection

NJU6675 interfaces with MPU by 8-bit bi-directional data bus (D7 to D0) or serial interface (SI). The 8-bit parallel or serial interface is determined by a condition of the P/S terminal connecting to "H" or "L" level as shown in Table 5. In case of the serial interface, status and RAM data read out operation is impossible.

Table 5

P/S	Type	$\overline{CS}$	A0	$\overline{RD}$	$\overline{WR}$	C86	SI	SCL	D0 to D7
H	Parallel	$\overline{CS}$	A0	$\overline{RD}$	$\overline{WR}$	C86	-	-	D0 to D7
L	Serial	$\overline{CS}$	A0	-	-	-	SI	SCL	-

### (5-2) Parallel Interface

The NJU6675 interfaces to 68 or 80 type MPU directly when setting the parallel interface (P/S="H") is selected. 68 type MPU or 80 is determined by the condition of C86 terminal connecting to "H" or "L" as shown in table 6.

Table 6

C86	Type	$\overline{CS}$	A0	$\overline{RD}$	$\overline{WR}$	D0 to D7
H	68 type MPU	$\overline{CS}$	A0	E	R/W	D0 to D7
L	80 type MPU	$\overline{CS}$	A0	$\overline{RD}$	$\overline{WR}$	D0 to D7

### (5-3) Discrimination of Data Bus Signal

The NJU6675 discriminates the mean of signal on the data bus by the combination of A0, E, R/W, and ( $\overline{RD}$ ,  $\overline{WR}$ ) signals as shown in Table 7.

Table 7

Common	68 type	80 type		Function
	R/W	$\overline{RD}$	$\overline{WR}$	
1	1	0	1	Read Display Data
1	0	1	0	Write Display Data
0	1	0	1	Status Read
0	0	1	0	Write into the Register(Instruction)

### (5-4) Serial Interface.(P/S="L")

Serial interface circuits consist of 8 bits shift register and 3 bits counter. SI and SCL input are activated when the chip select terminal  $\overline{CS}$  set to "L" and P/S terminal set to "L". The 8 bits shift register and 3 bits counter are reset to the initial condition when chip is not selected. The data input from SI terminal is MSB first like as the order of D7, D6, ..., D0, and the data are entered into the shift register synchronizing with the rise edge of the serial clock SCL. The data in the shift register are converted to parallel data at the 8th serial clock rise edge input. Discrimination of the display data or instruction of the serial input data is executed by the condition of A0 at the 8th serial clock rise edge. A0="H" is display data and A0="L" is instruction. When  $\overline{RES}$  terminal becomes "L" or  $\overline{CS}$  terminal becomes "H" before 8th serial clock rise edge, NJU6675 recognizes them as a instruction data incorrectly. Therefore a unit of serial data must be structured by 8-bit. The time chart for the serial interface is shown in Fig. 5. To avoid the noise trouble, the short wiring is required for the SCL input.

Note) The read out function, such as the status or RAM data read out, is not supported in this serial interface .

Fig.5

### (5-5) Access to the Display Data RAM and Internal Register.

The NJU6675 is operating as one of pipe-line processor by the bus-holder connecting to the internal data bus to adjust the operation frequency between MPU and the Display Data RAM or Internal Register.

For example, when the MPU reads out the data from the Display Data RAM, the read out data in the data read cycle (dummy read) is held in the bus-holder, then it is read out from the bus-holder to the system bus at the next data read cycle. When the MPU writes the data into the Display Data RAM, the data is held in the bus-holder, then it is written into the Display Data RAM by the next data write cycle.

Therefore high speed data transmission between MPU and NJU6675 is available because of it is not limited by the  $t_{acc}$  and  $t_{ds}$  as display data RAM access time and is limited by the system cycle time (R) or (W).

If the cycle time is not be kept in the MPU operation, NOP should be inserted to the system instead of the waiting operation.

The read out operation does not read out the data in the pointed address just after the address set operation. And second read out operation can read out the data correctly from the pointed address.

Therefore, one dummy read is required after address setting or write cycle as shown in Fig. 6.

#### ● Write Operation

#### ● Read Operation

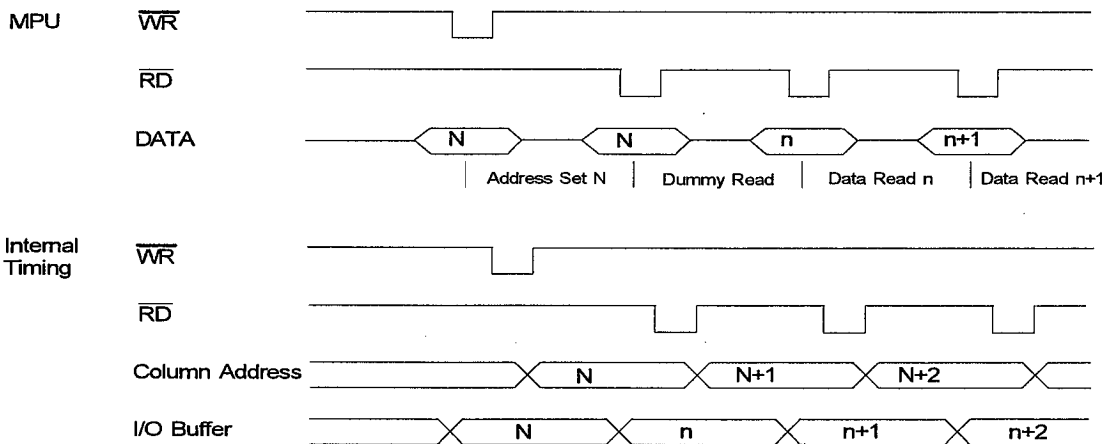

Fig.6

### (5-6) Chip Select

$\overline{CS}$  is Chip Select terminal. In case of  $\overline{CS}="L"$ , the interface with MPU is available. In case of  $\overline{CS}="H"$ , the Do to D7 are high impedance and A0,  $\overline{RD}$ ,  $\overline{WR}$ , SI and SCL inputs are ignored. If the serial interface is selected when  $\overline{CS}="H"$ , the shift register and counter are reset. However, the reset is always operated in any conditions of  $\overline{CS}$ .

## ■ ABSOLUTE MAXIMUM RATINGS

(Ta=25°C)

PARAMETER	SYMBOL	RATINGS	UNIT
Supply Voltage (1)	VDD	-0.3 to +7.0	V
		-0.3 to +3.6(used Tripler)	V
Supply Voltage (2)	V5	VDD-11.0 to VDD+0.3	V
Supply Voltage (3)	V1 to V4	V5 to VDD+0.3	V
Input Voltage	VIN	-0.3 to VDD+0.3	V
Operating Temperature	Topr	-30 to +80	°C
Storage Temperature	Tstg	-55 to +125 (Chip)	°C
		-55 to +100 (TCP)	

Note 1) If the LSI are used on condition above the absolute maximum ratings, the LSI may be destroyed.  
Using the LSI within electrical characteristics is strongly recommended for normal operation. Use beyond the electric characteristics conditions will cause malfunction and poor reliability.

Note 2) All voltage values are specified as Vss=0 V.

Note 3) The relation :  $VDD \geq V1 \geq V2 \geq V3 \geq V4 \geq V5$ ;  $VDD > Vss \geq VOUT$  must be maintained.

Note 4) Decoupling capacitor should be connected between VDD and Vss due to the stabilized operation for the voltage converter.

## ■ ELECTRICAL CHARACTERISTICS (1)

(VDD=2.4V to 3.3V, VSS=0V, Ta=-30 to +80°C)

PARAMETER	SYMBOL	CONDITIONS	MIN.	TYP.	MAX.	UNIT	Note
Operating Voltage(1)	VDD		2.4		3.3	V	5

		IOUT2				22	45		
IOUT3					21	43			
Voltage Reg.	VREG%	VDD=3V,Ta=25 °C				3	%	13	

Note 5) NJU6675 can operate wide operating range, but it is not guarantee immediate voltage changing during the accessing of the MPU.

Note 6) Apply to the High-impedance state of the Do to D7 terminals.

Note 7) RON is the resistance values between power supply terminals(V1, V2, V3, V4) and each output terminals of common and segment supplied by 0.1V. This is specified within the range of supply voltage (2).

Note 8,9,12) Apply to current after "LCD Driving Voltage Set".

Note 8) Apply to the external display clock operation in no access from the MPU and no use internal power supply circuits.

Note 9) Apply to the condition of cyclic (tcyc) inverted data input continuously in no use internal power supply circuits. The operating current during the accessing is proportionate to the access frequency. In the no accessing period, it is as same as IDD1X.

Note 10) Supply voltage (VDD) range for internal Voltage Tripler operation.

Note 11) LCD driving voltage V5 can be adjusted within the voltage follower operating range.

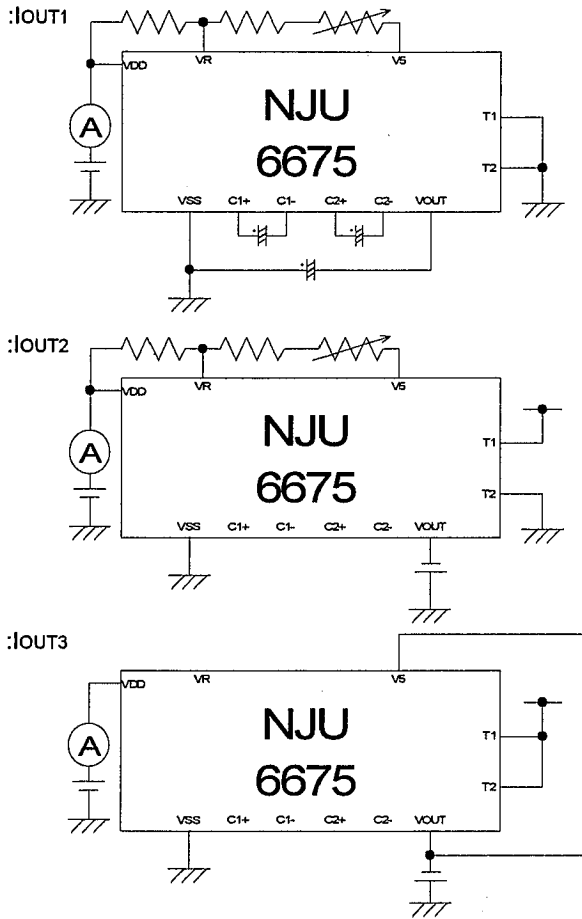

Note 12) Each operating current of voltage supply circuits block is specified under below table conditions.

SYMBOL	Status		Operating Condition				External Voltage Supply (Input Terminal)
	T1	T2	Internal Oscillator	Voltage Tripler	Voltage Adjustment	Voltage Follower	
IOUT1	L	*	Validity	Validity	Validity	Validity	Unuse
IOUT2	H	L	Validity	Invalidity	Validity	Validity	Use(VOUT)
IOUT3	H	H	Validity	Invalidity	Invalidity	Validity	Use(VOUT,V5)

(\* = Don't Care)

Note 13) Apply to the precision of the voltage between VDD and V5 with EVR function.

## MEASUREMENT BLOCK DIAGRAM

## ELECTRICAL CHARACTERISTICS (2)

(VDD=2.4V to 3.3V, VSS=0V, Ta=-30 to +80 C)

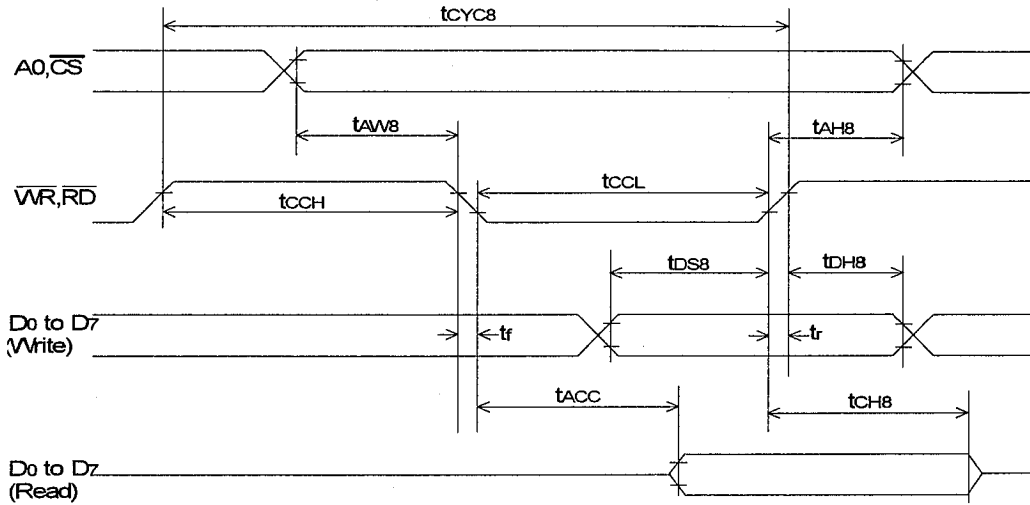

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNIT	Note
Reset time	$t_R$	$\overline{RES}$ Terminal	1.0			us	14
Reset "L" Level Pulse Width	$trw$	$\overline{RES}$ Terminal	10			us	15

Note 14) Specified from the rising edge of  $\overline{RES}$  to finish the internal circuit reset.

Note 15) Specified minimum pulse width of  $\overline{RES}$  signal. Over than  $trw$  "L" input should be required for correct reset operation.

## BUS TIMING CHARACTERISTICS

- Read/Write operation sequence (80 Type MPU)

(VDD=2.4V to 3.3V, Ta=-30 to +80°C)

PARAMETER		SYMBOL	MIN.	MAX.	CONDITION	UNIT
Address Hold Time	A0, CS	tA0H8	45			ns
Address Set Up Time	Terminals	tA0S8	45			ns
System Cycle Time	WR	tCYC8 (W)	770			ns
	RD	tCYC8 (R)	1025			ns
Control Pulse Width	WR, "L"	tCCL(W)	85			ns
