

Description

The μ PD80C35, μ PD80C48, and μ PD48 are true stand-alone 8-bit microcomputers fabricated using CMOS technology. All of the functional blocks necessary for an integrated microcomputer are incorporated, including a 1K-byte ROM (μ PD80C48 only), a 64-byte RAM, 27 I/O lines, an 8-bit timer/event counter, and a clock generator. This integrated capability permits use in stand-alone applications. For designs requiring extra capability, the μ PD80C35/ μ PD80C48 can be expanded using peripherals and is memory compatible with industry-standard 8080A/8085A processors.

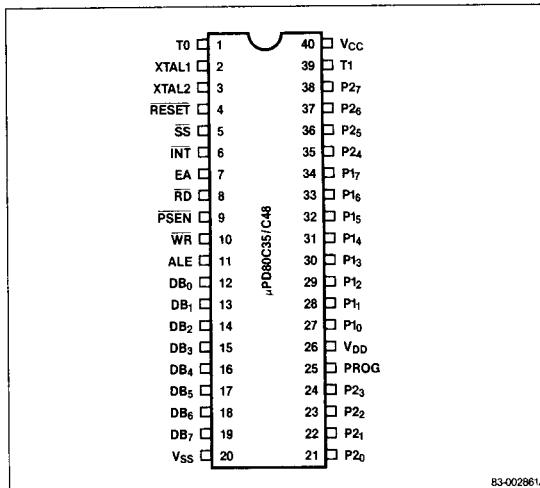

Providing compatibility with industry-standard 8048, 8748, and 8035 processors, the μ PD80C35/ μ PD80C48 features significant savings in power consumption. In addition to the power savings gained through CMOS technology, the μ PD80C35/ μ PD80C48 offers two standby modes (Halt and Stop modes) to further minimize power drain.

Features

- 8-Bit CPU with memory and I/O on a single-chip
- Hardware/software-compatible with industry-standard 8048, 8748, and 8035 processors
- 1K x 8 ROM (μ PD80C48 only)
- 64 x 8 RAM
- 27 I/O lines
- 2.5- μ s cycle time (6-MHz crystal)
- All instructions executable in 1 or 2 cycles
- 97 instructions: 70 percent are single-byte instructions
- Internal timer/event counter
- Two interrupts (external and timer)
- Easily expandable memory and I/O
- Bus compatible with 8080A/8085A peripherals
- Power-efficient CMOS technology requiring a single +2.5 to +6.0 V power supply
- Halt mode
- Stop mode

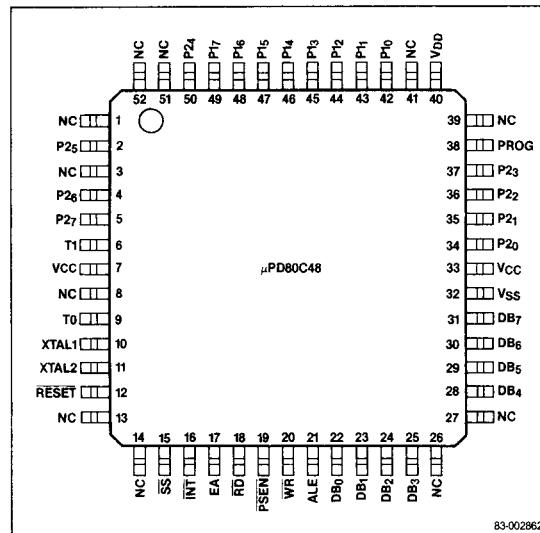

Pin Configurations

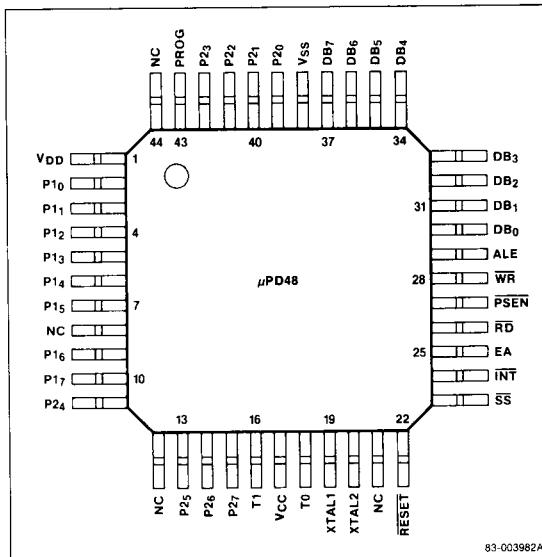

40-Pin Plastic DIP

4

52-Pin Plastic Miniflat

Pin Configurations (cont)**44-Pin Plastic Miniflat****Ordering Information**

Part Number	Package Type	Max Frequency of Operation	ROM
μ PD80C35C	40-pin plastic DIP	6 MHz	None
μ PD80C48C	40-pin plastic DIP	6 MHz	1K x 8
μ PD80C48G-00	52-pin plastic miniflat	6 MHz	1K x 8
μ PD48G-22	44-pin plastic miniflat	6 MHz	1K x 8

Note:

μ PD80C48C, μ PD80C48G-00, and μ PD48G-22 have two optional port types: type 0, $I_{OH} = -5 \mu A$; type 1, $I_{OH} = -50 \mu A$. Type 0 or 1 can be selected independently for P10-P17, P20-P23, and P24-P27.

Pin Identification

Symbol	Function
T0	Test 0 input/clock output
XTAL1	Crystal 1 input
XTAL2	Crystal 2 input
RESET	Reset input
SS	Software stop input
INT	Interrupt input
EA	External access input
RD	Read output
PSEN	Program store enable output
WR	Write output
ALE	Address latch enable output
DB0-DB7	Bidirectional data bus
V _{SS}	Ground
P20-P27	Quasi-bidirectional port 2
PROG	Program output
V _{DD}	Oscillator control voltage
P10-P17	Quasi-bidirectional port 1
T1	Test 1 input
V _{CC}	Primary power supply
NC	No connection

Pin Functions**XTAL1, XTAL2 [Crystals 1, 2]**

XTAL1 and XTAL2 are the crystal inputs for the internal clock oscillator. XTAL1 is also used as an input for external clock signals.

T0 [Test 0]

The JT0 and JNT0 instructions test the level of T0 and, if it is high, the program address jumps to the specified address. T0 becomes a clock output when the ENT0 CLK instruction is executed.

T1 [Test 1]

The JT1 and JNT1 instructions test the level of T1 and, if it is high, the program address jumps to the specified address. T1 becomes an internal counter input when the STRT CNT instruction is executed.

RESET [Reset]

RESET initializes the processor and is also used to verify the internal ROM. RESET determines the oscillation stabilizing time during the release of STOP mode. The RESET pulse width requires at least 5 machine cycles when the supply voltage is within specifications and the oscillation frequency is stable.

SS [Single Step]

SS causes the processor to execute the program one step at a time.

INT [Interrupt]

INT starts an interrupt if interrupts are enabled. A reset disables an interrupt. INT can be tested with the JMI instruction and, depending on the results, a jump to the specified address can occur.

EA [External Access]

EA disables internal program memory and fetches and accesses external program memory. EA is used for system testing and debugging.

RD [Read]

RD enables a data read from external memory.

WR [Write]

WR enables a data write to external memory.

PSEN [Program Store Enable]

PSEN fetches instructions only from external program memory.

ALE [Address Latch Enable]

ALE occurs at each cycle. The falling edge of ALE addresses external data memory or external program memory. ALE can also be used as a clock output.

DB₀-DB₇ [Data Bus]

DB₀-DB₇ is a bidirectional port, which reads and writes data using RD and WR for latching. During an external program memory fetch, DB₀-DB₇ output the low-order eight bits of the memory address. PSEN fetches the instruction. DB₀-DB₇ also output the address of an external data memory fetch. The addressed data is read and written by RD and WR.

P10-P17 [Port 1]

P10-P17 is an 8-bit quasi-bidirectional port.

P20-P27 [Port 2]

P20-P27 is an 8-bit quasi-bidirectional port. P20-P23 output the high-order four bits of the address during an external program memory fetch. P20-P23 also function as a 4-bit I/O bus for the μ PD82C43 I/O port expander.

PROG [Program Pulse]

PROG is used as an output pulse during a fetch when interfacing with the μ PD82C43 I/O port expander.

V_{DD} [Oscillator Control Voltage]

V_{DD} stops and starts the oscillator in STOP mode. STOP mode is enabled by forcing V_{DD} low during a rest.

V_{CC} [Primary Power Supply]

V_{CC} is the primary power supply. V_{CC} must be between +2.5 V and +6.0 V for normal operation. In STOP mode, V_{CC} must be at least +2.0 V to ensure data retention.

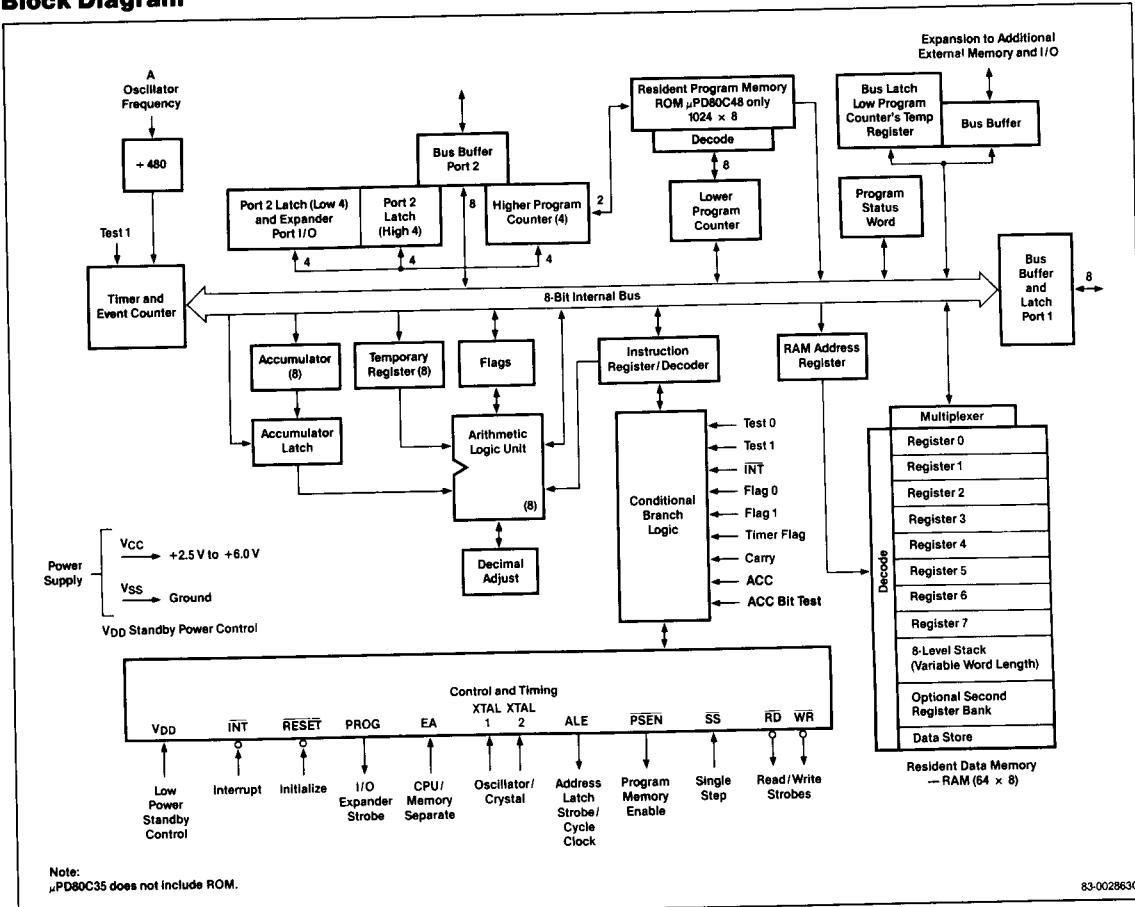

V_{SS} [Ground]

V_{SS} is ground potential.

NC [No Connection]

NC is no connection.

Block Diagram

Absolute Maximum Ratings

T_A = 25°C

Power supply voltage, V _{CC}	V _{SS} - 0.3 to +10 V
Input voltage, V _{IN}	V _{SS} - 0.3 to V _{CC} + 0.3 V
Output voltage, V _O	V _{SS} - 0.3 to V _{CC} + 0.3 V
Operating temperature, T _{OPT}	-40°C to +85°C
Storage temperature, T _{STG}	-65°C to +150°C

Comment: Exposing the device to stresses above those listed in Absolute Maximum Ratings could cause permanent damage. The device is not meant to be operated under conditions outside the limits described in the operational sections of the specification. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

DC Characteristics

Standard Voltage Range

T_A = -40°C to +85°C, V_{CC} = +5 V ± 10%, V_{SS} = 0 V

Parameter	Symbol	Limits				Test Conditions
		Min	Typ	Max	Unit	
Input voltage low	V _{IL}	-0.3		+0.8	V	
Input voltage high	V _{IH}	V _{CC} - 2		V _{CC}	V	Except XTAL1, XTAL2, RESET
	V _{IH1}	V _{CC} - 1		V _{CC}	V	RESET, XTAL1, XTAL2
Output voltage low	V _{OL}		+0.45	V	I _{OL} = 2.0 mA	
Output voltage high	V _{OH}	2.4		V	Bus, RD, WR, PSEN, ALE, PROG, T0; I _{OH} = -100 μA	
	V _{OH1} (1)	2.4		V	I _{OH} = -5 μA (type 0) port 1, port 2	
		2.4		V	I _{OH} = -50 μA (type 1) port 1, port 2	
	V _{OH2}	V _{CC} - 0.5		V	All outputs, I _{OH} = -0.2 μA	
Input current	I _{ILP} (1)	-15	-40	μA	Port 1, port 2; V _{IN} ≤ V _{IL} (type 0)	
			-500	μA	Port 1, port 2; V _{IN} ≤ V _{IL} (type 1)	
	I _{ILC}		-40	μA	SS, RESET; V _{IN} ≤ V _{IL}	
Input leakage current	I _{LI1}		±1	μA	T1, INT, V _{CC} ; V _{SS} ≤ V _{IN} ≤ V _{CC}	
	I _{LI2}		±3	μA	EA; V _{SS} ≤ V _{IN} ≤ V _{CC}	
Output leakage current	I _{LO}		±1	μA	V _{SS} ≤ V _O ≤ V _{CC} High impedance, bus, T0	
Standby current	I _{CC1}	0.4	0.8	mA	Halt mode t _{CY} = 2.5 μs	
	I _{CC2}	1	20	μA	Stop mode (Note 2)	
Supply current	I _{CC}	4	8	mA	t _{CY} = 2.5 μs	
Data retention voltage	V _{CCDR}	2.0		V	Stop mode (V _{DD} , RESET ≤ 0.4 V)	

Extended Voltage Range

T_A = -40°C to +85°C, V_{CC} = +2.5 V to +6.0 V, V_{SS} = 0 V

Parameter	Symbol	Limits				Test Conditions
		Min	Typ	Max	Unit	
Input voltage low	V _{IL}	-0.3		+0.18 V _{CC}	V	
Input voltage high	V _{IH}	0.7 V _{CC}		V _{CC}	V	Except XTAL1, XTAL2
	V _{IH1}	0.8 V _{CC}		V _{CC}	V	XTAL1, XTAL2
Output voltage low	V _{OL}		+0.45	V	I _{OL} = 1.0 mA	
Output voltage high	V _{OH}	0.75 V _{CC}		V	Bus, RD, WR, PSEN, ALE, PROG, T0; I _{OH} = -100 μA	
	V _{OH1}	0.7 V _{CC}		V	All other outputs; I _{OH} = -1 μA (type 0) port 1, port 2	
		0.7 V _{CC}		V	All other outputs; I _{OH} = -10 μA (type 1) port 1, port 2	
Input current	I _{ILP}		-15	-40	μA	Port 1, port 2; V _{IN} ≤ V _{IL} (type 0)
				-500	μA	Port 1, port 2; V _{IN} ≤ V _{IL} (type 1)
Input leakage current	I _{IL}			-40	μA	SS, RESET; V _{IN} ≤ V _{IL}
	I _{LI1}			±1	μA	T1, INT, V _{SS} < V _{IN} < V _{CC}
	I _{LI2}			±5	μA	EA; V _{SS} < V _{IN} < V _{CC}
Output leakage current	I _{LO}			±1	μA	V _{SS} < V _O < V _{CC} , Bus, T0 — high impedance state
Supply current	I _{CC}		0.8	1.6	mA	V _{CC} = 3 V, t _{CY} = 10 μs
			6	12	μA	V _{CC} = 6 V, t _{CY} = 25 μs
Standby current	I _{CC1}		100	200	μA	Halt mode; V _{CC} = 3 V, t _{CY} = 10 μs
			0.6	1.2	mA	V _{CC} = 6 V, t _{CY} = 2.5 μs
	I _{CC2}		1	20	μA	Stop mode, V _{CC} = 3 V
			1	50	μA	V _{CC} = 6 V

Note:

(1) Types 0, 1 for μPD80C48 only.

Type 0 for μPD80C35 only.

(2) Input pin voltage is V_{IN} ≤ V_{IL}, or V_{IN} ≥ V_{IH}.

AC Characteristics

Read, Write and Instruction Fetch: External Data and Program Memory

$T_A = -40^\circ\text{C}$ to $+85^\circ\text{C}$; $V_{CC} = V_{DD} = +5V \pm 10\%$; $V_{SS} = 0V$

Parameter	Symbol	Limits				Test Unit Conditions

Low Power Standby Operation

1) Halt Mode (When EI)

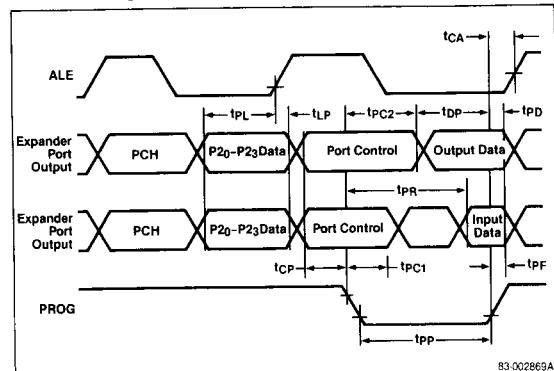

2) Stop Mode

4

Port 2 Timing

Functional Description

Standby Function

Halt Mode

In Halt mode, the oscillator continues to operate, but the internal clock is disabled. The status of all internal logic just prior to execution of the HALT instruction is maintained by the CPU. In Halt mode, power consumption is less than 10 percent of normal μ PD80C48 operation and less than 1 percent of normal 8048 operation.

The Halt mode is initiated by execution of the HALT instruction, and is released by either INT or RESET input.

INT Input. When the INT pin receives a low-level input, if interrupts are enabled, the internal clock is restarted and the interrupt is executed after the first or second instruction following the HALT instruction. However, if interrupts are disabled, program operation is resumed from the next address following the HALT instruction. The first instruction following a HALT instruction should be a NOP instruction to ensure proper program execution.

If the Halt mode is released when interrupts are enabled, the interrupt service routine is usually executed after the first or second instruction following the release of Halt mode. However, if either a timer or external interrupt is accepted within one machine cycle prior to a HALT instruction, the corresponding timer or external interrupt service routine is executed immediately following the release of Halt mode. It is important to note this sequence of execution when considering interrupt service routine execution following a HALT instruction.

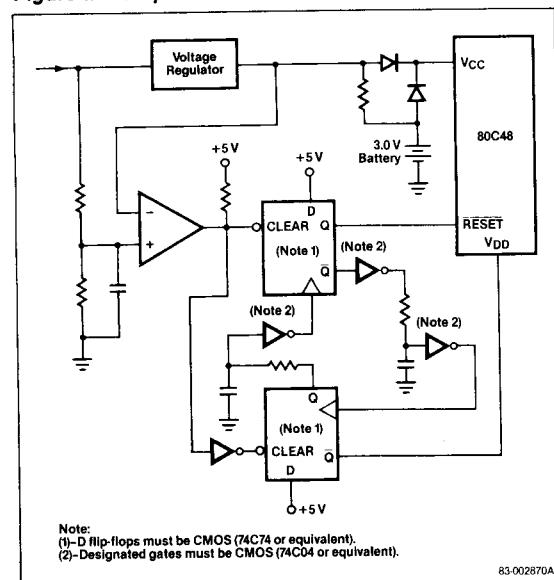

RESET Input. When a low-level input is received by the RESET pin, Halt mode is released and the normal reset operation is activated, restarting program operation from address 0.

Stop Mode

In Stop mode, the oscillator is deactivated and only the contents of RAM are maintained. The operation status of the μ PD80C35/ μ PD80C48 resembles that of a reset condition. Because only the contents of RAM are maintained, Stop mode provides even lower power consumption than Halt mode, only requiring a minimum V_{CC} as low as +2V.

Stop mode is initiated by setting V_{DD} to low when RESET is low, to protect the contents of RAM. Stop mode is released by first raising the supply voltage at the V_{CC} pin from standby level to correct operating level and setting V_{DD} to high when RESET is low. After the oscillator has been restarted and the oscillation has stabilized, RESET must be set to high, whereby program operation is started from address 0. Figure 1 shows the Stop mode circuit.

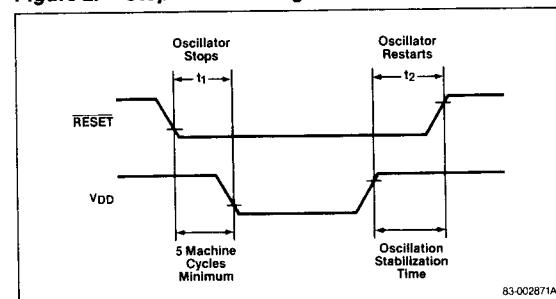

Figure 1. Stop Mode Circuit

83-002870A

Stop Mode Circuit. Since V_{DD} controls the restarting of the oscillator, it is important that V_{DD} be protected from noise interference. The time required to reset the CPU is represented by t₁ (see figure 2), which is a minimum of 5 machine cycles. The reset operation will not be completed in less than 5 machine cycles. In Stop mode, it is important to note that if V_{DD} goes low before 5 machine cycles have elapsed, the CPU will be deactivated and the output of ALE, RD, WR, PSEN, and PROG will not have been stabilized.

Figure 2. Stop Mode Timing

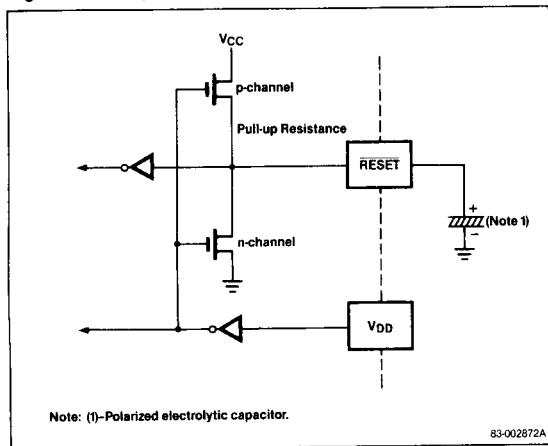

83-002871A

Oscillation stabilization time is represented by t_2 (see figure 2). When V_{DD} goes high, oscillator operation is reactivated, but it takes time before oscillation can be stabilized. In particular, such high Q resonators as crystals require longer periods to stabilize. Because there is a delay between restarting of the oscillator and oscillator stabilization, t_2 should be long enough to ensure that the oscillator has been fully stabilized.

To facilitate Stop mode control, an external capacitor can be connected to the RESET pin (see figure 3), affecting only t_2 , allowing control of the oscillator stabilization time. When V_{DD} is asserted in Stop mode, the capacitor begins charging, pulling up RESET. When RESET reaches a threshold level equivalent to a logic 1, Stop mode is released. The time it takes RESET to reach the threshold level of logic 1 determines the oscillator stabilization time, which is a function of the capacitance and pull-up resistance values.

Figure 3. Stop Mode Control Circuit

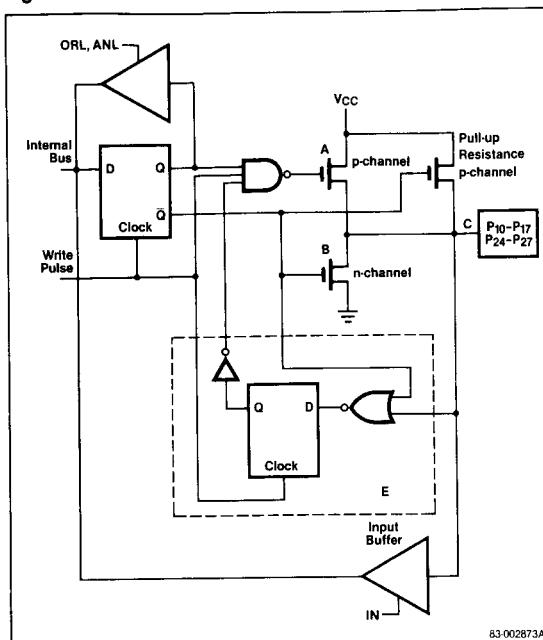

Port Operation

A port-loading option is offered at the time of ordering the mask. Individual source current requirements for Port 1 and the upper and lower halves of Port 2 may be factory set at either $-5\mu A$ or $-50\mu A$ (see Port-Loading Options table). The $-50\mu A$ option is required for interfacing with TTL/NMOS devices. The $-5\mu A$ option is recommended for interfacing to other CMOS devices. The CMOS option results in lower power consumption and greater noise immunity.

Port lines P10-P17 and P24-P27 include a protective circuit "E" to prevent a signal conflict at the port. The circuit prevents a logic 1 from being written to a line that is being pulled down externally (see figure 4, Port Protection Circuit E diagram). When a logic 0 is detected at the port line and a logic 1 is written from the bus, the NOR gate sends a logic 1 to the D input of the flip-flop. The output is inverted, forcing the NAND gate to send a high-level output. This turns off transistor A, preventing the output of a logic 1 from the port.

Figure 4. Port Protection Circuit E

Port-Loading Options

I_{OH} (min) $V_{CC} = V_{DD} = 5V \pm 10\%$; $V_{OH} = 2.4V$ (min)

Option Selected	P1 ₀ -P1 ₇	P2 ₀ -P2 ₃	P2 ₄ -P2 ₇	Unit
A	-5	-5	-5	μA
B	-50	-5	-5	μA
C	-5	-50	-5	μA
D	-50	-50	-5	μA
E	-5	-5	-50	μA
F	-50	-5	-50	μA
G	-5	-50	-50	μA
H	-50	-50	-50	μA

Note:

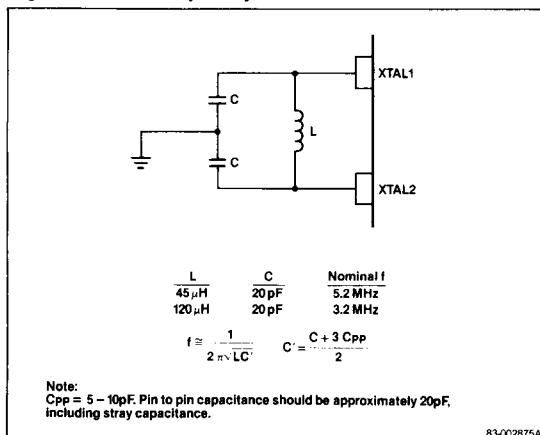

- (1) The selection of $I_{OH} = -5\mu A$ will result in a port source current of $|I_{LP}| = -40\mu A$ max when used as input port.
- (2) The selection of $I_{OH} = -50\mu A$ will result in a port source current of $|I_{LP}| = -500\mu A$ max when used as input port.

Oscillator Operation

The oscillator maintains an internal frequency for clock generation and controls all system timing cycles. The oscillation is initiated by either a self-generating external resonator or external clock input. The oscillator acts as a high-gain amplifier which produces square-wave pulses at the frequency determined by the resonator or clock source to which it is connected.

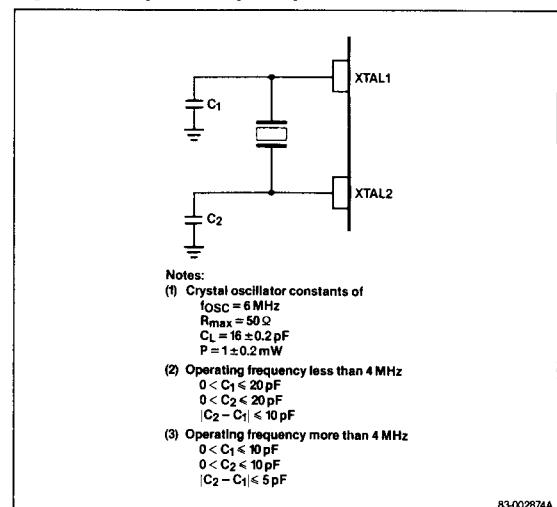

To obtain the oscillation frequency, an external LC network (figure 5) may be connected to the oscillator, or a ceramic or crystal external resonator (figure 6) may be connected.

Figure 5. LC Frequency Reference Circuit

83-002875A

Figure 6. Crystal Frequency Reference Circuit

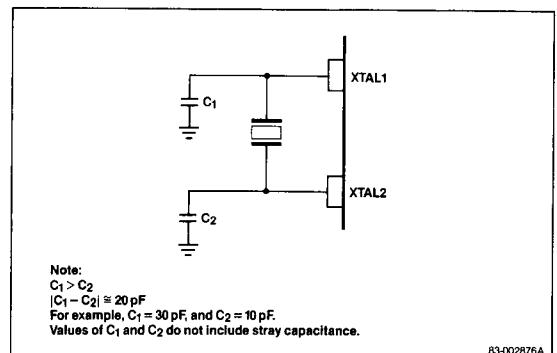

83-002874A

As the crystal frequency is lowered, there is an equivalent reduction in series resistance (R). As the temperature of the crystal is lowered, R is increased. Due to this relationship, it becomes difficult to stabilize oscillation when there is low power supply voltage. When V_{CC} is less than 2.7 V and the oscillator frequency is 3 MHz or less, T_A (ambient temperature) should not be less than -10°C .

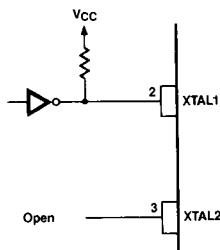

Figures 7 and 8 show the ceramic resonator and external clock frequency reference circuits. Figure 9 shows the μ PD80C35/ μ PD80C48 major I/O signals.

Figure 7. Ceramic Resonator Frequency Reference Circuit

83-002876A

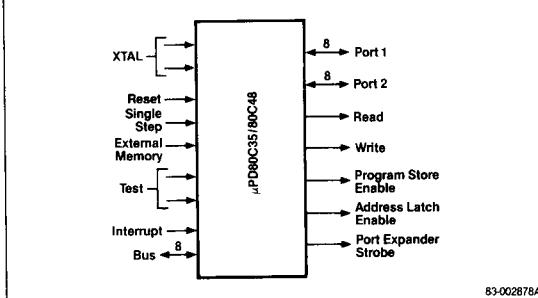

Figure 8. External Clock Frequency Reference Circuit

Note:
A minimum voltage of $V_{CC} - 1$ is required for XTAL1 to go HIGH.

Instruction Set

Instruction Set Symbol Definitions

Symbol	Description
A	Accumulator
AC	Auxiliary carry flag
addr	Program or data memory address (a_0-a_7) or (a_0-a_9)
b	Accumulator bit ($b = 0-7$)
BS	Bank switch
BUS	Bus
C	Carry flag
CLK	Clock
CNT	Counter
data	8-bit binary data (d_0-d_7)
DBF	Memory bank flip-flop
F0, F1	Flag 0, flag 1
INT	Interrupt pin
n	Indicates the hex number of the specified register or port
PC	Program counter
Pp	Port 1, port 2, or ports 4-7 ($p=1, 2$ or $4-7$)
PSW	Program status word
Rr	Register ($r=0-7$)

Symbol	Description
SP	Stack pointer
T	Timer
TF	Timer flag
T0, T1	Test 0, test 1 pin
#	Prefix for immediate data
@	Prefix for indirect address
x	Indicates the hex number corresponding to the accumulator bit or page number specified in the operand
(x)	Contents of RAM
((x))	Contents of memory location addressed by (x)
←	Transfer direction, result
AND	Logical product (logical AND)
OR	Logical sum (logical OR)
EXOR	Exclusive-OR
—	Complement

Instruction Set (cont)

Mnemonic	Function	Description	Operation Code						Bytes			
			Hex Code	D ₇	D ₆	D ₅	D ₄	D ₃	D ₂			
Accumulator												
ADD A, # data	(A) \leftarrow (A) + data	Adds immediate data d ₀ -d ₇ to the accumulator. Sets or clears both carry flags. (Note 2)	03	0	0	0	0	0	0	1	2	
ADD A, Rr	(A) \leftarrow (A) + (Rr) r = 0-7	Adds the contents of register Rr to the accumulator. Sets or clears both carry flags. (Note 2)	d ₇	d ₆	d ₅	d ₄	d ₃	d ₂	d ₁	d ₀	2	
ADD A, @ Rr	(A) \leftarrow (A) + ((Rr)) r = 0-1	Adds the contents of the internal data memory location specified by bits 0-5 of register Rr to the accumulator. Sets or clears both carry flags. (Note 2)	6n(4)	0	1	1	0	1	r	r	1	1
ADDC A, # data	(A) \leftarrow (A) + (C) + data	Adds, with carry, immediate data d ₀ -d ₇ to the accumulator. Sets or clears both carry flags. (Note 2)	13	0	0	0	1	0	0	1	2	
ADDC A, Rr	(A) \leftarrow (A) + (C) + (Rr) r = 0-7	Adds, with carry, the contents of register Rr to the accumulator. Sets or clears both carry flags. (Note 2)	7n(4)	0	1	1	1	r	r	r	1	1
ADDC A, @ Rr	(A) \leftarrow (A) + (C) + ((Rr)) r = 0-1	Adds, with carry, the contents of the internal data memory location specified by bits 0-5 of register Rr, to the accumulator. Sets or clears both carry flags. (Note 2)	7n(4)	0	1	1	0	0	0	r	1	1
ANL A, # data	(A) \leftarrow (A) AND data	Takes the logical product (logical AND) of immediate data d ₀ -d ₇ and the contents of the accumulator, and stores the result in the accumulator.	53	0	1	0	1	0	0	1	2	
ANL A, Rr	(A) \leftarrow (A) AND (Rr) r = 0-7	Takes the logical product (logical AND) of the contents of register Rr and the accumulator, and stores the result in the accumulator.	d ₇	d ₆	d ₅	d ₄	d ₃	d ₂	d ₁	d ₀	1	
ANL A, @ Rr	(A) \leftarrow (A) AND ((Rr)) r = 0-1	Takes the logical product (logical AND) of the contents of the internal data memory location specified by bits 0-5 of register Rr, and the accumulator, and stores the result in the accumulator.	5n(4)	0	1	0	1	1	r	r	r	1
CPL A	(A) \leftarrow (\bar{A})	Takes the complement of the contents of the accumulator.	37	0	0	1	1	0	1	1	1	
CLR A	(A) \leftarrow 0	Clears the contents of the accumulator.	27	0	0	1	0	0	1	1	1	
DA A		Converts the contents of the accumulator to BCD. Sets or clears the carry flags. When the lower 4 bits (A ₀ -A ₃) are greater than 9, or if the auxiliary carry flag has been set, adds 6 to (A ₀ -A ₃). When the upper 4 bits (A ₄ -A ₇) are greater than 9 or if the carry flag (C) has been set, adds 6 to (A ₄ -A ₇). If an overflow occurs at this point, C is set. (Note 2)	57	0	1	0	1	0	1	1	1	
DEC A	(A) \leftarrow (A) - 1	Decrements the contents of the accumulator by 1.	07	0	0	0	0	1	1	1	1	
INC A	(A) \leftarrow (A) + 1	Increments the contents of the accumulator by 1.	17	0	0	1	0	1	1	1	1	
ORL A, # data	(A) \leftarrow (A) OR data	Takes the logical sum (logical OR) of immediate data d ₀ -d ₇ and the contents of the accumulator, and stores the result in the accumulator.	43	0	1	0	0	0	1	1	2	
ORL A, Rr	(A) \leftarrow (A) OR (Rr) r = 0-7	Takes the logical sum (logical OR) of register Rr and the contents of the accumulator, and stores the result in the accumulator.	4n(4)	0	1	0	0	1	r	r	r	1

Instruction Set (cont)

Mnemonic	Function	Description	Operation Code								Cycles	
			Hex Code	D ₇	D ₆	D ₅	D ₄	D ₃	D ₂	D ₁	D ₀	Bytes
Subroutine												
CALL addr	((SP)) \leftarrow (PC) (PSW ₄ -PSW ₇) (SP) \leftarrow (SP) + 1 (PC ₈ -PC ₀) \leftarrow (addr ₈ -addr ₁) (PC ₀ -PC ₇) \leftarrow (addr ₀ -addr ₇) (PC ₁₁) \leftarrow DBF	Stores the contents of the program counter and the upper 4 bits of the PSW in the address indicated by the stack pointer, and increments the contents of the stack pointer, calling the subroutine specified by address a ₀ -a ₁₀ and the DBF.	x4(6)	a ₁₀ a ₇	a ₉ a ₆	a ₈ a ₅	a ₇ a ₄	a ₆ a ₃	a ₅ a ₂	a ₄ a ₁	0 a ₀	0 2
RET	(SP) \leftarrow (SP) - 1 (PC) \leftarrow ((SP))	Decrements the contents of the stack pointer by 1 and stores, in the program counter, the contents of the location specified by the stack pointer, executing a return from subroutine without restoring the PSW.	83	1	0	0	0	0	0	1	1	2
RETR	(SP) \leftarrow (SP) - 1 (PC) \leftarrow ((SP)) (PSW ₄ -PSW ₇) \leftarrow ((SP))	Decrements the contents of the stack pointer by 1 and stores, in the program counter, the contents of the upper 4 bits of the PSW and the contents of the location specified by the stack pointer, executing a return from subroutine with restoration of the PSW.	93	1	0	0	1	0	0	1	1	2
Timer / Counter												
EN TCNTI		Enables internal interrupt of timer / event counter. If an overflow condition occurs, then an interrupt will be generated.	25	0	0	1	0	0	1	0	1	1
DIS TCNTI		Disables internal interrupt of timer / event counter.	35	0	0	1	1	0	1	0	1	1
MOV A, T	(A) \leftarrow (T)	Moves the contents of the timer / counter into the accumulator.	42	0	1	0	0	0	0	1	0	1
MOV T, A	(T) \leftarrow (A)	Moves the contents of the accumulator into the timer / counter.	62	0	1	1	0	0	0	1	0	1
STOP TCNT		Stops the operation of the timer / event counter.	65	0	1	1	0	0	1	0	1	1
STRT CNT		Starts the event counter operation of the timer / counter when T1 changes from a low-level input to a high-level input.	45	0	1	0	0	0	1	0	1	1
STRT T		Starts the timer operation of the timer / counter. The timer is incremented every 32 machine cycles.	55	0	1	0	1	0	1	0	1	1
Miscellaneous												
NOP		Uses one machine cycle without performing any operation.	00	0	0	0	0	0	0	0	1	1

Instruction Set (cont)**Note:**

- (1) Binary operation code designations *r* and *p* represent encoded values or the lowest-order bit value of specified registers and ports, respectively.
- (2) Execution of the ADD, ADCD, and DA instructions affect the carry flags, which are not shown in the respective function equations. These instructions set the carry flags when there is an overflow in the accumulator (the auxiliary carry flag is set when there is an overflow of bit 3 of the accumulator) and clear the carry flags when there is no overflow. Flags that are specifically addressed by tag instructions are shown in the function equations for those instructions.

- (3) References to addresses and data are specified in byte 1 and/or 2 in the opcode of the corresponding instruction.

- (4) The hex value of *n* for specific registers is as follows:

- a) Direct addressing
R0: n = 8 R2: n = A R4: n = C R6: n = E
R1: n = 9 R3: n = B R5: n = D R7: n = F

- b) Indirect addressing
@ R0: n = 0 @ R1: n = 1

- (5) The hex value of *n* for specific ports is as follows:

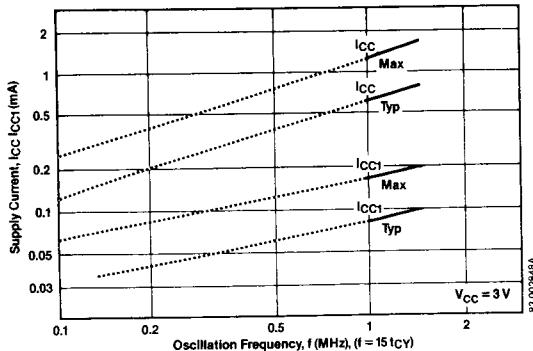

- P1: n = 9 P4: n = C P6: n = E
P2: n = A P5: n = D P7: n = F

- (6) The hex value of *x* for specific accumulator or address bits is as follows:

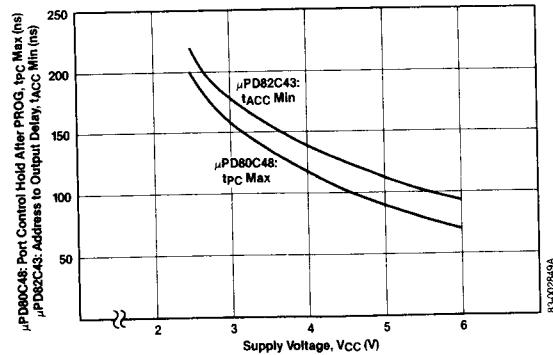

- a) JBb instruction
B₀: x = 1 B₂: x = 5 B₄: x = 9 B₆: x = D
B₁: x = 3 B₃: x = 7 B₅: x = B B₇: x = F
- b) JMP instruction
Page 0: x = 0 Page 2: x = 4 Page 4: x = 8 Page 6: x = C
Page 1: x = 2 Page 3: x = 6 Page 5: x = A Page 7: x = E
- c) CALL instruction
Page 0: x = 1 Page 2: x = 5 Page 4: x = 9 Page 6: x = D
Page 1: x = 3 Page 3: x = 7 Page 5: x = B Page 7: x = F
