

Audio sound controller

BH3857FV

The BH3857FV is a signal-processing IC for controlling audio quality in CD radio-cassette players and mini-component stereo systems. Three-line serial control is available making it easy to adjust tone and volume using a microprocessor.

●Applications

Mini-component stereo systems, CD radio cassette players, car audio systems and TVs.

●Features

- 1) Volume (main volume) and tone (bass and treble) control possible by direct serial link to a microprocessor. DC control is also possible.
- 2) Volume control is done with a low-distortion, low-noise VCA, and step noise is suppressed.
- 3) The gain of the input amplifier can be adjusted, and two surround matrixes are available to expand the sound.
- 4) The IC includes a stable reference voltage source and input buffer to reduce external component requirements, and comes in a compact 40-pin SSOP package that is perfect for compact designs.
- 5) Four open-collector outputs are provided to make logic control possible.

●Absolute maximum ratings (Ta = 25°C)

Parameter	Symbol	Limits	Unit
Applied voltage	V _{CC}	10.0	V
Power dissipation	P _d	1000	mW
Operating temperature	T _{opr}	-40~+85	°C
Storage temperature	T _{stg}	-55~+150	°C
Port terminal voltage	PORT1~PORT4	15.0	V
Control terminal voltage	V _c , T _c B _c , S _c	V _{REF}	V

* Reduced by 8mW for each increase in Ta of 1°C over 25°C.

●Recommended operating conditions (Ta = 25°C)

Parameter	Symbol	Min.	Typ.	Max.	Unit
Supply voltage	V _{CC}	5.4	8.0	9.5	V

7828999 0019377 965

●Block diagram

Sound control

○Control of volume, bass, treble and surround 2 can also be done by external application of a DC voltage to the VC (volume), BC (bass), TC (treble) and SC (surround 2) terminals.

○The impedance of the VC, TC, and BC terminals is 10k Ω (typ.).

○The impedance of the SC terminal is 200k Ω (typ.).

● Measurement circuit

Fig. 1

7828999 0019381 396

●Circuit operation

(1) About the data format

As shown in Fig. 2, there are 32 bits of data.
When the power is applied, a reset is applied to switch ports 1 to 4 off, but the reset is not applied to the other ports, so they are unstable. For this reason, it is necessary to input the data at least once while the set mute circuit is on.

Fig. 2

Data	Function
D00~D07	Volume control
D08~D12	Treble control
D13~D17	Bass control
D18~D19	Surround control
D20~D23	Port control
D24~D31	Chip select + parity

※D18 : Surround matrix 1 control
D19 : Surround matrix 2 control

D20	D21	D22	D23
Port 1	Port 2	Port 3	Port 4

- Surround is on when the bit data is 0, and off when it is 1.
- With regard to the port 1 to 4 outputs, when the power is on, if no data is input the transistors for each output are set to off. The outputs are on when the bit data is 1, and off when it is 0.

※Apply the following data for chip select and parity.

D24	.	.	.	.	.	.	D31
0	1	0	1	0	1	1	1

(2) Logic input terminals

Logic input terminals have a bipolar construction,
so take care with regard to source current.

(3) Timing chart

The timing chart is shown in Fig. 3.

Timing (recommended conditions)

Fig.3

Timing chart constants

Parameter	Symbol	Min.	Typ.	Max.	Unit
H input voltage	V_{IH}	4.0	5.0	6.0	V
L input voltage	V_{IL}	—	0	1.0	V
Minimum clock width	t_w	2.0	—	—	μS
Minimum data width	t_w (DATA)	2.0	—	—	μS
Minimum latch width	t_w (LATCH)	2.0	—	—	μS
Setup time (DATA to CLK)	t_{su}	1.0	—	—	μS
Hold time (CLK to DATA)	t_h	1.0	—	—	μS
Setup time (CLK to LATCH)	t_s	1.0	—	—	μS

* Hold the logic terminal inputs at a "L" voltage until the voltage on the V_{CC} terminal reaches the minimum operating voltage (5.4V). The port terminals (pins 26 to 29) are off (open) at this time.

7828999 0019383 169

(4) Data table

The transmission data is given in the table below.

Volume data settings (reference values)

Hex display	Volume gain	MSB							LSB

Note: 1. The gain values given in the bass data setting table above are for when the filter constants are set so that the peak or bottom values in the frequency characteristic graph become the maximum or minimum gain values.

2. The values given in this table are for reference only. Be sure to check them carefully in actual use.

●External components

(1) Input buffer

- The input impedance is 47kΩ.
- A buffer if R and C₁ are not present.
- The gain can be set by R and the 20kΩ.

$$G_{VC} = (R + 20k\Omega) / R$$

Note: Set C₂ (input coupling) and C₁ (used to set the gain) depending on the frequency band used.

(2) Bass filter

• A band-pass filter is constructed using a multiple-feedback type active filter.
F₀ can be changed using the C valve.

(Theoretical formula)

$$f_0 = \frac{1}{2\pi} \times \left(\frac{1}{R_1 R_2 C_1 C_2} \right)^{\frac{1}{2}} \quad Q \doteq \left(\left(\frac{1}{R_2 C_1 C_2} \right)^{\frac{1}{2}} \times (C_1 + C_2) \right)^{-1}$$

$$G = \frac{R_2}{5k} \times \left(1 + \frac{C_1}{C_2} \right)^{-1}$$

Note: The filter gain is calculated using these formulas, but the internal circuit must be added to give the total output gain.

(When R₁=11.5kΩ, R₂=85kΩ, and C₁=C₂=C)

$$f_0 = \frac{5.1 \times 10^{-6}}{C} \quad Q \doteq 1.36 \quad G = 8.5$$

7828999 0019387 804

(3) Treble filter

- The bypass filter cutoff frequency (f_{c1}) can be altered by changing the value of the external capacitor C_3 .

$$f_{c1} = \frac{1}{2\pi \times C_3 \times 2k}$$

The recommended value for f_{c1} is about 8kHz.

- The bandwidth of the internal amplifier is determined by f_{c2} (about 100kHz).

The tone control provides gain boost or cut over a frequency range that you decide. At the peak and bottom of the frequency characteristic the boost is 15dB, and the cut is -15dB (Typ.). Take the frequency characteristic into consideration when designing the filter.

1) Amount of tone boost

When the amount of volume attenuation is large, the tone control width will change. Reference values are given below.

Note, however, that the actual values will vary due to differences in individual components.

Reference values :

Tone control width at 0dB volume attenuation : ± 15.0 dB
 Tone control width at -40dB volume attenuation : ± 13.5 dB
 Tone control width at -60dB volume attenuation : ± 12.0 dB

(4) Surround matrix

1) Surround 1

Circuit example

• Gain setting

Same-phase gain $\frac{1}{2} \times \frac{R_1 + 4.7k}{R_1}$ (1ch, 2ch)

Single-phase gain $\frac{1}{2} \times \frac{(R_1 // R_2) + 4.7k}{R_1 // R_2}$ (1ch)

$\frac{1}{2} \times \frac{4.7k}{R_2}$ (2ch)

(* Channel 1 input, channel 2 AC ground)

Reverse-phase gain $\frac{1}{2} \times \frac{(R_1 // R_2) / 2 + 4.7k}{(R_1 // R_2) / 2}$ (1ch, 2ch)

• Mixing signal frequency characteristic settings

$f_{c1} = \frac{1}{2\pi C_2 R_2}$ (Hz)

$f_{c2} = \frac{1}{2\pi C_1 \times 4.7k}$ (Hz)

7828999 0019389 687

2) Surround 2

● Operation notes

We guarantee the application circuit design, but recommend that you thoroughly check its characteristics and pay attention to the points of caution given below. If you change any of the external component values, check both the static and transient characteristics of the circuit, and allow sufficient margin in your selections to take into account variations in the components and ICs.

(1) Supply voltage range

The basic circuit functions are guaranteed to operate if the circuit is operated within the recommended temperature and supply voltage ranges. Please confirm the values of the circuit constants, voltage setting, and temperature in actual use.

(2) Step switching noise

The VC (pin 37), TC (pin 36), BC (pin 35), and SC (pin 25) terminals have components connected to them in the application example circuit. The values of these components may need to be changed depending on the signal level setting and PCB pattern. Investigate carefully before deciding on the values of the various circuit constants.

The equivalent circuit for these terminals is given below (an integrator circuit is set at the first stage to slow the variation).

	R value (kΩ)
VC, BC, TC	10
SC	200

◎ The surround matrix construction is shown in the diagram on the left.

The gain calculations are given by the formulas in the diagram.

Same-phase gain	0dB
Reverse-phase gain	3.5dB

(However, the reverse-phase gain is input to one channel only)

(3) Volume and tone level settings

This specification sheet gives reference values for the amount of attenuation and gain with respect to the serial control data.

The internal D/A convertor is an R-2R circuit, and data exists for the places where continuous variation does not occur between data.

Use this when fine setting is required. The setting limits are up to 8 bits for volume (256 steps) and 5 bits (32 steps) for tone.

(4) Digital/analog separation

The digital and analog power supplies and grounds are completely separate. The digital circuits are supplied from a stable reference source that is on the chip (VREF (pin 31)). For this reason, there is no need to worry about timing shifts, or interference due to digital noise.

(5) Output ports

Ports 1 to 4 (pins 26 to 29), are reset when the power is applied. The reset state continues until the next serial data is input.

Note: The CK, DATA and LATCH line data must be held low up until the next data is input after power is applied.

• Do not apply more than 15V to the output ports.

(6) DC control

An internal impedance of 10kΩ is seen from the VC (pin 37), TC (pin 36), and BC (pin 35) terminals, and 200kΩ is seen from the SC (pin 25) terminal, so with regard to DC control, we recommend direct control with the voltage source.

When using variable volume, take the impedance into consideration when making the setting.

Note: The DC control voltage range is 0V to VREF.

Do not apply voltages above VREF to the terminals.
