Parity Bus Transceivers

Am29833A/Am29853A/Am29855A

DISTINCTIVE CHARACTERISTICS

- High-speed bidirectional bus transceivers for processor organized devices
 - T-R delay = 6 ns typical
 - R_i-Parity delay = 9 ns typical
- Error flag with open-collector output
- Generates odd parity for all-zero protection
- 200-mV minimum input hysteresis (Commercial) on input data ports
- High drive capability:
 - 48 mA Commercial I_{OL}
 - 32 mA Military I_{OL}
- Higher speed, lower power versions of the Am29833 & Am29853
- Am29855A adds new functionality

GENERAL DESCRIPTION

The Am29833A, Am29853A, and Am29855A are high-performance parity bus transceivers designed for two-way communications. Each device can be used as an 8-bit transceiver, as well as a 9-bit parity checker/generator. In the transmit mode, data is read at the R port and output at the T port with a parity bit. In the receive mode, data and parity are read at the T port, and the data is output at the R port along with an ERR flag showing the result of the parity test.

In the Am29833A, the error flag is clocked and stored in a register which is read at the open-collector ERR output. The CLR input is used to clear the error flag register. In the Am29853A, a latch replaces this register, and the EN and CLR controls are used to pass, store, sample or clear the error flag output. When both output enables are disabled in the Am29853A and Am29833A, the parity logic defaults to

the transmit mode, so that the ERR pin reflects the parity of the R port. The Am29855A, a variation of the Am29853A, is designed so that when both output enables are HIGH, the ERR pin retains its current state.

The output enables, $\overline{OER}$ and $\overline{OET}$, are used to force the port outputs to the high-impedance state so that other devices can drive bus lines directly. In addition, the user can force a parity error by enabling both $\overline{OER}$ and $\overline{OET}$ simultaneously. This transmission of inverted parity gives the designer more system diagnostic capability.

Each of these devices is produced with AMD's proprietary IMOX* bipolar process, and features typical propagation delays of 6 ns, as well as high-capacitive drive capability. Package options include DIPs, PLCCs, LCCs, SOICs, and Flatpacks.

Valid Combinations list configurations planned to be supported in volume for this device. Consult the local AMD sales office to confirm availability of specific valid combinations or to check for newly released valid combinations.

Group A Tests

Group A tests consist of Subgroups
1, 2, 3, 7, 8, 9, 10, 11.

Am29833A/Am29853A/Am29855A

PIN DESCRIPTION

T-52-31

Am29833A/Am29853A/Am29855A

Am29833A, Am29853A/Am29855A**OER Output Enable-Receive (Input, Active LOW)**

When LOW in conjunction with $\overline{\text{OET}}$ HIGH, the devices are in the Receive mode (R_i are outputs, T_i and Parity are inputs).

 $\overline{\text{OET}}$ Output Enable-Transmit (Input, Active LOW)

When LOW in conjunction with $\overline{\text{OER}}$ HIGH, the devices are in the Transmit mode (R_i are inputs, T_i and Parity are outputs).

 R_i Receive Port (Input/Output, Three-State)

R_i are the 8-bit data inputs in the Transmit mode, and the outputs in the Receive mode.

 T_i Transmit Port (Input/Output, Three-State)

T_i are the 8-bit data outputs in the Transmit mode, and the inputs in the Receive mode.

Parity Parity Flag (Input/Output, Three-State)

In the Transmit mode, the Parity signal is an active output used to generate odd parity. In the Receive mode, the T_i and Parity inputs are combined and checked for odd parity. When both output enables are HIGH, the Parity Flag is in the high impedance state. When both output enables are LOW, the Parity bit forces a parity error.

Am29833A Only**ERR Error Flag (Output, Open Collector)**

In the Receive mode, the parity of the T_i bits is calculated and compared to the Parity input. ERR goes LOW when the comparison indicates a parity error. ERR stays LOW until the register is cleared.

CLR Clear (Input, Active LOW)

When CLR goes LOW, the Error Flag Register is cleared (ERR goes HIGH).

CLK Clock (Input, Positive Edge-Triggered)

This pin is the clock input for the Error Flag register.

Am29853A/Am29855A Only**ERR Error Flag (Output, Open Collector)**

In the Receive mode, the parity of the T_i bits is calculated and compared to the Parity input. ERR goes LOW when the comparison indicates a parity error. ERR stays LOW until the latch is cleared. In the Am29855A, the error flag will retain its previous state when $\overline{\text{OET}}$ and $\overline{\text{OER}}$ are HIGH.

CLR Clear (Input, Active LOW)

When CLR goes LOW and EN is HIGH, the Error Flag latch is cleared (ERR goes HIGH).

EN Latch Enable (Input, Active LOW)

This pin is the latch enable for the Error Flag latch.

ABSOLUTE MAXIMUM RATINGS

Storage Temperature -65 to +150°C
 Ambient Temperature with
 Power Applied -55 to +125°C
 Supply Voltage to Ground Potential
 Continuous -0.5 V to +7.0 V
 DC Voltage Applied to Output
 for High Output State -0.5 V to +5.5 V
 DC Input Voltage -1.5 V to +6.0 V
 DC Output Current, into Outputs 100 mA
 DC Input Current -30 mA to +5.0 mA

Stresses above those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent device failure. Functionality at or above these limits is not implied. Exposure to absolute maximum ratings for extended periods may affect device reliability.

OPERATING RANGES**Commercial (C) Devices**

Temperature (T_A) 0 to +70°C
 Supply Voltage (V_{CC}) +4.5 V to +5.5 V

Military (M) Devices

Temperature (T_C) -55 to +125°C
 Supply Voltage (V_{CC}) +4.5 V to +5.5 V

Operating ranges define those limits between which the functionality of the device is guaranteed.

DC CHARACTERISTICS over operating range unless otherwise specified (for APL Products, Group A, Subgroups 1, 2, 3 are tested unless otherwise noted)
