

3 Pin Microprocessor Supervisor Circuit

FEATURES

- Ultra Low Supply Current 1 μ A (typ.)
- Guaranteed Reset valid to $V_{CC} = 0.9V$
- 140 ms Min. Power-On Reset Pulse Width
- Internally Fixed Threshold 2.3V, 2.6V, 2.9V, 3.1V, 4.0V, 4.4V, 4.6V
- Tight Voltage Threshold Tolerance: 1.5%
- Offered in a 3 Pin SOT-23 Package

Now Available in Lead Free Packaging

Part Number	Output Type
SP809N	Open-Drain Active Low
SP809	Push-Pull Active Low
SP810	Push-Pull Active High

APPLICATIONS

- Portable Electronic Devices
- Electrical Power Meter
- Digital Still Camera
- μ P Power Monitoring

DESCRIPTION

The SP809/SP810 are low power microprocessor (μ P) supervisory circuits used to monitor power supplies in μ P and digital systems. They provide applications with benefits of circuit reliability and low cost by eliminating external components. If the V_{CC} supply voltage falls below preset threshold then a reset signal is asserted for at least 140ms after V_{CC} has risen above the reset threshold. Both the SP809 and SP810 were designed with a reset comparator to help identify invalid signals, which last less than 140ms. The only difference between them is that they have an active-low $\overline{\text{RESET}}$ output and active-high RESET output, respectively. Low supply current (1 μ A) makes SP809/SP810 ideal for portable equipment. The devices are available in 3 pin SOT-23 package.

TYPICAL APPLICATION CIRCUIT

ABSOLUTE MAXIMUM RATINGS

V_{CC}	-0.3V to 6.5V
RESET, RESET	-0.3 to $V_{CC} + 0.3V$
Input Current (V_{CC})	20mA
Output Current (RESET, RESET)	20mA
Continuous Power Dissipation ($T_A = +70^\circ C$)	320mW
Operating Junction Temperature	$-40^\circ C$ to $+85^\circ C$
Junction Temperature	$125^\circ C$

Storage Temperature	$-65^\circ C$ to $+150^\circ C$
Lead Temperature (soldering 10 sec)	$125^\circ C$

These are stress ratings only and functional operation of the device at these ratings or any other above those indicated in the operation sections of the specifications below is not implied. Exposure to absolute maximum rating conditions for extended periods of time may affect reliability.

ELECTRICAL CHARACTERISTICS

Note 1. Specifications are production tested at $T_A = 25^\circ\text{C}$. Specifications over the -40°C to 85°C operating temperature range are assured by design, characterization and correlation with Statistical Quality Controls

Note 2. RESET output is for SP809; RESET output is for SP810.

DETAILED DESCRIPTION

μP will be activated at a valid reset state. These μP supervisory circuits assert reset to prevent code execution errors during power-up, power-down, or brownout conditions.

Reset is guaranteed to be a logic low for $V_{\text{TH}} > V_{\text{CC}} > 0.9\text{V}$. Once V_{CC} exceeded the reset threshold, an internal timer keeps $\overline{\text{RESET}}$ low for the reset timeout period; after this interval, $\overline{\text{RESET}}$ goes high.

If a brownout condition occurs (V_{CC} drops below the reset threshold), $\overline{\text{RESET}}$ goes low. Any time V_{CC} goes below the reset threshold, the internal timer resets to zero, and $\overline{\text{RESET}}$ goes low. The internal timer is activated after V_{CC} returns above the reset threshold, and $\overline{\text{RESET}}$ remains low for the reset timeout period.

Benefits of Highly Accurate Reset Threshold

SP809/810 with specified voltage as $5\text{V} \pm 10\%$ or $3\text{V} \pm 10\%$ are ideal for systems using a $5\text{V} \pm 5\%$ or $3\text{V} \pm 5\%$ power supply. The reset is guaranteed to assert after the power supply falls below the minimum specified operating voltage range of the system ICs. The pretrimmed thresholds are reducing the range over which an undesirable reset may occur.

APPLICATION INFORMATION

Negative-Going V_{CC} Transients

In addition to issuing a reset to the μP during power-up, power-down, and brownout conditions, SP809 series are relatively resistant to short-duration negative-going V_{CC} transient.

Ensuring a Valid Reset Output Down to VCC= 0

When V_{CC} falls below 0.9V, SP809 $\overline{\text{RESET}}$ output no longer sinks current; it becomes an open circuit. In this case, high-impedance CMOS logic inputs connecting to $\overline{\text{RESET}}$ can drift to undetermined voltages. Therefore, SP809/810 with CMOS is perfect for most applications of V_{CC} down to 0.9V.

However in applications where $\overline{\text{RESET}}$ must be valid down to 0V, adding a pull-down resistor to $\overline{\text{RESET}}$ causes any leakage currents to flow to ground, holding $\overline{\text{RESET}}$ low.

Interfacing to μP with Bidirectional Reset Pins

The $\overline{\text{RESET}}$ output on the SP809N is open drain, this device interfaces easily with μPs that have bidirectional reset pins. Connecting the μP supervisor's $\overline{\text{RESET}}$ output directly to the microcontroller's RESET pin with a single pull-up resistor allows either device to assert reset.
