Dual Trip SOT Temperature Switches

MAX6505–MAX6508

_____General Description

The MAX6505–MAX6508 temperature switches have dual logic outputs that assert when the die temperature crosses their trip thresholds. Trip thresholds are factory programmed to convenient temperatures in 5°C increments.

The MAX6505/MAX6506 have an ALARM output that asserts when the temperature is above the factory-programmed thresholds (available from -40°C to +125°C). They also have a WARN output that asserts when the temperature is several degrees below the ALARM threshold. The difference between the ALARM and WARN thresholds (ΔT_{AW}) is pin selectable to +5°C, +10°C, +20°C, or +30°C. The MAX6505's logic outputs are open drain, while the MAX6506's logic outputs are push-pull.

The MAX6507 has open-drain outputs ($\overline{OVER}$, OK), and the MAX6508 has push-pull outputs (OVER, $\overline{OK}$), each with two factory-programmed threshold temperatures (T_{OVER} and T_{UNDER}) in the wide range of -40°C to +125°C. The overtemperature output asserts when the temperature is above T_{OVER}. When the temperature is in the desired window (less than T_{OVER} and greater than T_{UNDER}), OK ($\overline{OK}$) asserts.

The MAX6505–MAX6508 are accurate to ±0.5°C (typ), ±5.5°C (max). Operating from a +2.5V to +5.5V supply, these low-cost devices typically consume 30µA supply current and require no external components for setting trip points. The MAX6505–MAX6508 are available in a 6-pin SOT23 package.

Detailed Description

The MAX6505–MAX6508 fully integrated temperature switches incorporate two temperature-dependent references and a comparator. One reference exhibits a positive temperature coefficient and the other a negative temperature coefficient. The temperature at which the two reference voltages are equal determines the temperature trip point. There are two versions, each of which has two logic outputs.

The MAX6505/MAX6506 have a main trip point (T_{ALARM}) and a lower, "warning" trip point (T_{WARN}). When the die temperature rises above these trip points, the ALARM and WARN outputs are asserted (Figure 1). The difference between the two trip points (ΔT_{AW}) is pin selectable to +5°C, +10°C, +20°C, or +30°C by connecting the two control pins (S0 and S1) high or low (Table 1). MAX6505 has open-drain active-low outputs; MAX6506 has push-pull active-high outputs.

The MAX6507/MAX6508 have two factory-programmed threshold temperatures (T_{OVER} and T_{UNDER}) and two outputs (OK and OVER). One output (OK) asserts when the temperature is between T_{OVER} and T_{UNDER}. The other output (OVER) asserts when the temperature is above T_{OVER}. Table 4 shows the hex codes to determine the part numbers associated with specific values of T_{OVER} and T_{UNDER}. The first hex code indicates the lower trip point (T_{UNDER}) and the second indicates the higher trip point (T_{OVER}). For example, a part with T_{UNDER} = -10°C and T_{OVER} = +75°C will have the part number MAX6508UTA04B (Table 4 and Figure 2). MAX6507 has open-drain outputs; MAX6508 has push-pull outputs.

Hysteresis Selection

The temperature threshold hysteresis for the ALARM output of the MAX6505/MAX6506 is 2°C. The hysteresis for the WARN output depends on the value of ΔT_{AW}. If ΔT_{AW} is 5°C or 10°C (set by S0 and S1), WARN hysteresis is 5°C. If ΔT_{AW} is 20°C or 30°C, WARN hysteresis is 10°C. MAX6507 and MAX6508 have pin-selectable hysteresis of 2°C or 10°C for both OVER and OK outputs (Table 2).

Applications Information

Thermal Considerations

The MAX6505–MAX6508 supply current is typically 30µA. When used to drive high-impedance loads, the devices dissipate negligible power. Therefore, the die temperature is essentially the same as the package temperature. The key to accurate temperature monitoring is good thermal contact between the MAX6505–MAX6508 package and the device being monitored. In

some applications, the SOT23-6 packages may be small enough to fit underneath a socketed microprocessor (µP), allowing the device to monitor the µP's temperature directly. Use the monitor's output to reset the µP, assert an interrupt, or trigger an external alarm. Accurate temperature monitoring depends on the thermal resistance between the device being monitored and the MAX6505–MAX6508 die.

The rise in die temperature due to self-heating is given by the following formula:

$$\Delta T_J = P_{DISSIPATION} \times \theta_{JA}$$

where $P_{DISSIPATION}$ is the power dissipated by the MAX6505–MAX6508, and θ_{JA} is the package's thermal resistance. The typical thermal resistance is +115°C/W for the SOT23-6 package. To limit the effects of self-heating, minimize the output currents. For example, if the MAX6505 sinks 5mA, the output voltage is guaranteed to be less than 0.5V. Therefore, an additional 2.5mW of

Figure 3. Low-Power, High-Reliability, Fail-Safe Temperature Monitor

power is dissipated within the IC. This corresponds to a +0.288°C shift in the die temperature in the SOT23-6.

Power Supply and Bypassing

The MAX6505 and MAX6508 operate from a single-supply voltage in the +2.5V to +5.5V range. Connect a 0.1µF capacitor on the supply voltage line close to the V_{CC} pin for bypassing.

Low-Cost, Fail-Safe Temperature Monitor

The MAX6505/MAX6506 provide two outputs that can be used for fail-safe temperature applications (Figure 3). For example, the first output can activate a fan when the die temperature exceeds a certain preset temperature. The second output asserts at a higher temperature that could be caused by a wide variety of destructive fault conditions, including latchup, short circuit, and cooling system failure. This output can be used to initiate such actions as shutdown of the entire system (see *Typical Operating Circuits*).

The high-level integration, low cost, and small size of the MAX6505–MAX6508 facilitate the use of multiple temperature monitors to increase system reliability.

Temperature-Window Alarm

The MAX6507 and MAX6508 have an output (OK, $\overline{OK}$) that indicates the die temperature is within the selected temperature window. This output is asserted when within the window, and deasserted when outside the window. Additionally, a second digital output indicates when the die temperature is above the upper set point. This is useful in systems where operation is optimized over a predetermined temperature range. The thermal overrange signal can be used to assert a thermal shutdown, power-up, recalibration, or other temperature-dependent function (Figure 4 and *Typical Operating Circuits*).
