#### 1.2 Description

The HYS64D[32020/16000]HDL-6-C and are industry standard 200-Pin Small Outline Dual-In-Line Memory Modules (SO-DIMMs) organized as 32M × 64 and 16M × 64. The memory array is designed with Double Data Rate Synchronous DRAMs (DDR SDRAM). A variety of decoupling capacitors are mounted on the PC board. The DIMMs feature serial presence detect based on a serial E<sup>2</sup>PROM device using the 2-pin I<sup>2</sup>C protocol. The first 128 bytes are programmed with configuration data and the second 128 bytes are available to the customer.

**Table 1 Ordering Information**

Type	Compliance Code	Description	SDRAM Technology
<b>PC2700 (CL=2.5)</b>			
HYS64D16000HDL-6-C	PC2700S-2533-0-C1	one rank 128 MB SO-DIMM	256 MBit (×16)
HYS64D32020HDL-6-C	PC2700S-2533-0-A1	two ranks 256 MB SO-DIMM	256 MBit (×16)

**Notes**

1. All part numbers end with a place code designating the silicon-die revision. Reference information available on request. Example: HYS64D32020GDL-6-B, indicating rev. B dies are used for SDRAM components.
2. The Compliance Code is printed on the module labels describing the speed sort (for example "PC2700"), the latencies and SPD code definition (for example "2033-0" means CAS latency of 2.0 clocks, RCD<sup>1)</sup> latency of 3 clocks, Row Precharge latency of 3 clocks, and JEDEC SPD code definition version 0), and the Row Card used for this module.

**Attention: Permanent damage to the device may occur if “Absolute Maximum Ratings” are exceeded. This is a stress rating only, and functional operation should be restricted to recommended operation conditions. Exposure to absolute maximum rating conditions for extended periods of time may affect device reliability and exceeding only one of the values may cause irreversible damage to the integrated circuit.**

1)  $0\text{ }^\circ\text{C} \leq T_A \leq 70\text{ }^\circ\text{C}$

2) Peak to peak AC noise on  $V_{REF}$  may not exceed  $\pm 2\%$   $V_{REF(DC)}$ .  $V_{REF}$  is also expected to track noise variations in  $V_{DDQ}$ .

3)  $V_{TT}$  is not applied directly to the device.  $V_{TT}$  is a system supply for signal termination resistors, is expected to be set equal to  $V_{REF}$ , and must track variations in the DC level of  $V_{REF}$ .

4)  $V_{ID}$  is the magnitude of the difference between the input level on CK and the input level on  $\overline{CK}$ .

5) The ratio of the pull-up current to the pull-down current is specified for the same temperature and voltage, over the entire temperature and voltage range, for device drain to source voltage from 0.25 to 1.0 V. For a given output, it represents the maximum difference between pull-up and pull-down drivers due to process variation.

6) Inputs are not recognized as valid until  $V_{REF}$  stabilizes.

7) Values are shown per DDR SDRAM component

 $m \times I_{DDx}[\text{component}] + n \times I_{DD3N}[\text{component}]$  with  $m$  and  $n$  number of components of rank 1 and 2;  $n=0$  for 1 rank modules

- 1)  $0\text{ }^{\circ}\text{C} \leq T_A \leq 70\text{ }^{\circ}\text{C}$ ;  $V_{DDQ} = 2.5\text{ V} \pm 0.2\text{ V}$ ,  $V_{DD} = +2.5\text{ V} \pm 0.2\text{ V}$
- 2) Input slew rate  $\geq 1\text{ V/ns}$
- 3) The CK/ $\overline{\text{CK}}$  input reference level (for timing reference to CK/ $\overline{\text{CK}}$ ) is the point at which CK and  $\overline{\text{CK}}$  cross: the input reference level for signals other than CK/ $\overline{\text{CK}}$ , is  $V_{REF}$ . CK/ $\overline{\text{CK}}$  slew rate are  $\geq 1.0\text{ V/ns}$ .
- 4) Inputs are not recognized as valid until  $V_{REF}$  stabilizes.
- 5) The Output timing reference level, as measured at the timing reference point indicated in AC Characteristics (note 3) is  $V_{TT}$ .
- 6) These parameters guarantee device timing, but they are not necessarily tested on each device.
- 7)  $t_{HZ}$  and  $t_{LZ}$  transitions occur in the same access time windows as valid data transitions. These parameters are not referred to a specific voltage level, but specify when the device is no longer driving (HZ), or begins driving (LZ).
- 8) The specific requirement is that DQS be valid (HIGH, LOW, or some point on a valid transition) on or before this CK edge. A valid transition is defined as monotonic and meeting the input slew rate specifications of the device. When no writes were previously in progress on the bus, DQS will be transitioning from Hi-Z to logic LOW. If a previous write was in progress, DQS could be HIGH, LOW, or transitioning from HIGH to LOW at this time, depending on  $t_{DQSS}$ .
- 9) The maximum limit for this parameter is not a device limit. The device operates with a greater value for this parameter, but system performance (bus turnaround) degrades accordingly.
- 10) Fast slew rate  $\geq 1.0\text{ V/ns}$ , slow slew rate  $\geq 0.5\text{ V/ns}$  and  $< 1\text{ V/ns}$  for command/address and CK &  $\overline{\text{CK}}$  slew rate  $> 1.0\text{ V/ns}$ , measured between  $V_{OH(ac)}$  and  $V_{OL(ac)}$ .
- 11) For each of the terms, if not already an integer, round to the next highest integer.  $t_{CK}$  is equal to the actual system clock cycle time.
- 12) A maximum of eight Autorefresh commands can be posted to any given DDR SDRAM device.
